2024/5/27 updated

Saha equation gives the relative proportions of atoms of a certain species that are in two different states of ionization in thermal equilibrium

$$\frac{n_{r+1}n_e}{n_r} = \frac{G_{r+1}g_e}{G_r}\frac{(2\pi m_e KT)^{3/2}}{h^3}\exp\left(-\frac{\chi_r}{KT}\right)$$

- n_{r+1}, n_r: Density of atoms in ionization state r+1, r (m^{-3})
- n_e: Density of electrons (m^{-3})
- G_{r+1}, G_r: Partition function of ionization state r+1, r
- g_e=2: Statistical weight of the electron
- m_e: Mass of the electron
- χ_r: Ionization potential of ground level of state r to reach to the ground level of state r+1
- T: Temperature
- h: Planck's constant
- K: Boltzmann constant

Supplement to Ch. 6 of Astrophysics Processes by Hale Bradt
(http://homepages.spa.umn.edu/~kd/Ast4001-2015/NOTES/n052-saha-bradt.pdf)

Saha equation – example: hydrogen plasma of the sun

- Photosphere of the sun – hydrogen atoms in an optically thick gas in thermal equilibrium at temperature T=6400 K.
  - Neutral hydrogen (r state / ground state)

$$G_r = \Sigma \mathrm{g}_{r,k} = g_{r,0} + g_{r,1}\mathrm{exp}\left(-\frac{\epsilon_{r,1}}{\mathrm{KT}}\right) + \cdots = 2 + 8\mathrm{exp}\left(-\frac{10.2\mathrm{eV}}{0.56\mathrm{eV}}\right) + \cdots$$
$$= 2 + 9.8 \times 10^{-8} + \cdots \approx 2$$

  - Ionized state (r+1 state)

$$G_{r+1} = \Sigma \mathrm{g}_{r+1,j} = g_{r+1,0} + g_{r+1,1}\mathrm{exp}\left(-\frac{\epsilon_{r+1,1}}{\mathrm{KT}}\right) + \cdots \approx 1$$

  - Other information: $g_e = 2$ $\chi_r = 13.6\mathrm{eV}$; $\mathrm{kT} = 0.56\mathrm{eV}$ $n_{r+1} = n_e$

$$\frac{{n_{r+1}}^2}{n_r} = 2.41 \times 10^{21}\,\frac{1 \times 2}{2}(6400)^{3/2}\mathrm{exp}\left(-\frac{13.6}{0.56}\right) = 3.5 \times 10^{16} m^{-3}$$

It is mostly neutral in the photosphere of the sun

- **Assuming 50 % ionization:**

$$n_{r+1} = n_r = 3.5 \times 10^{16} m^{-3} \qquad n = n_{r+1} + n_r = 7 \times 10^{16} m^{-3}$$

- **In the photosphere of the sun:**

$$\rho \sim 3 \times 10^{-4}\,\mathrm{kg}/m^3 \rightarrow n = 2 \times 10^{23} m^{-3} \gg 7 \times 10^{16} m^{-3}$$

- **At higher densities n at the same temperature, there should be more collisions leading to higher recombination rate and thus the plasma is less than 50 % ionization.**

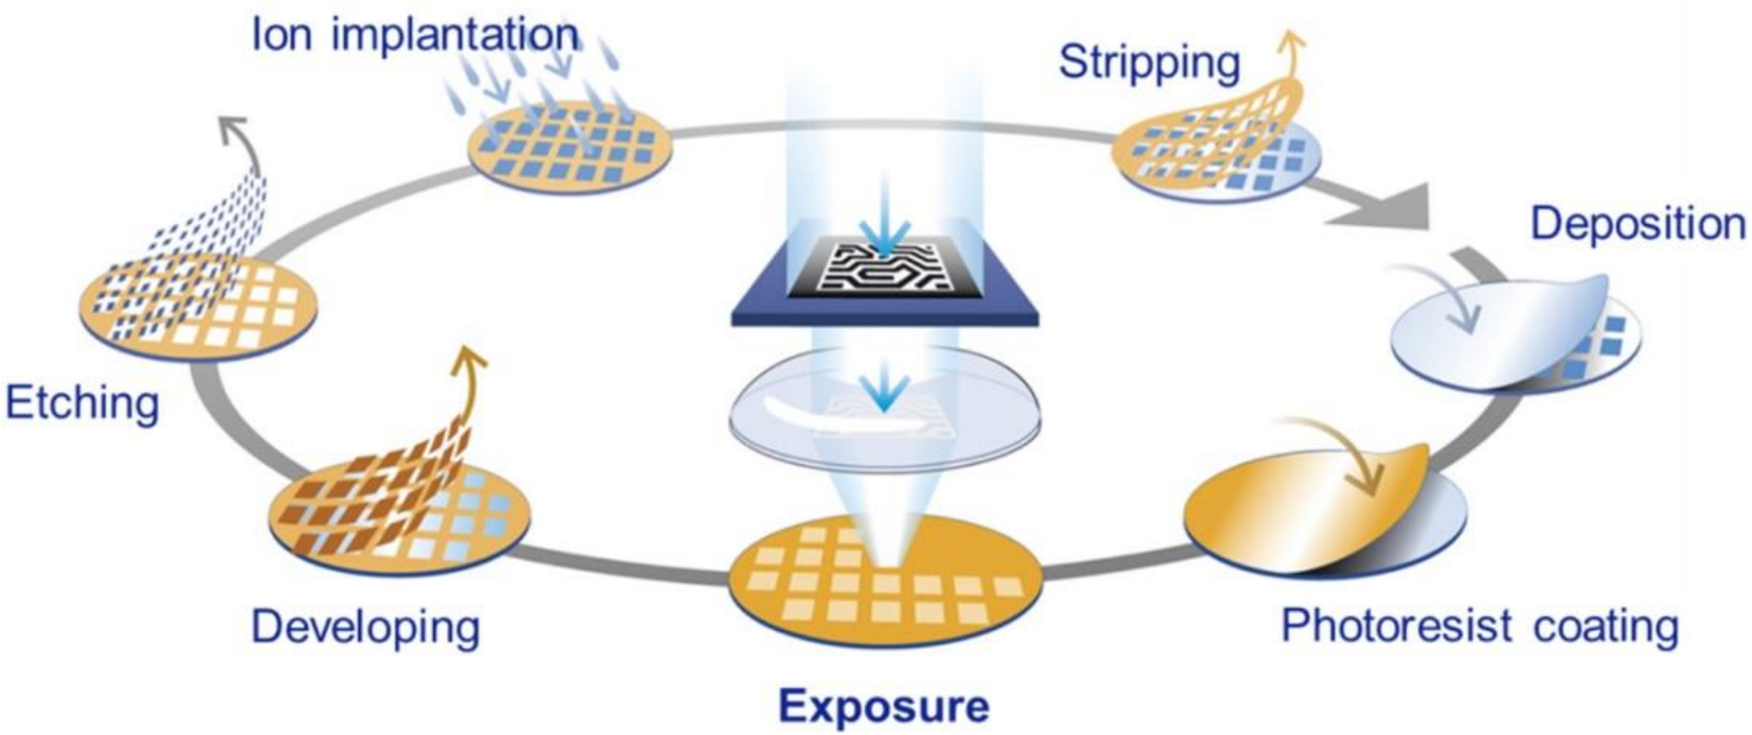
$\Rightarrow$ **Less than 50 % ionization**

- **Use the total number density to estimate the ionization percentage:**

$$n_{r+1} + n_r = 2 \times 10^{23}$$

$$\frac{n_{r+1}}{n_r} = 4 \times 10^{-4} @ 6400K$$

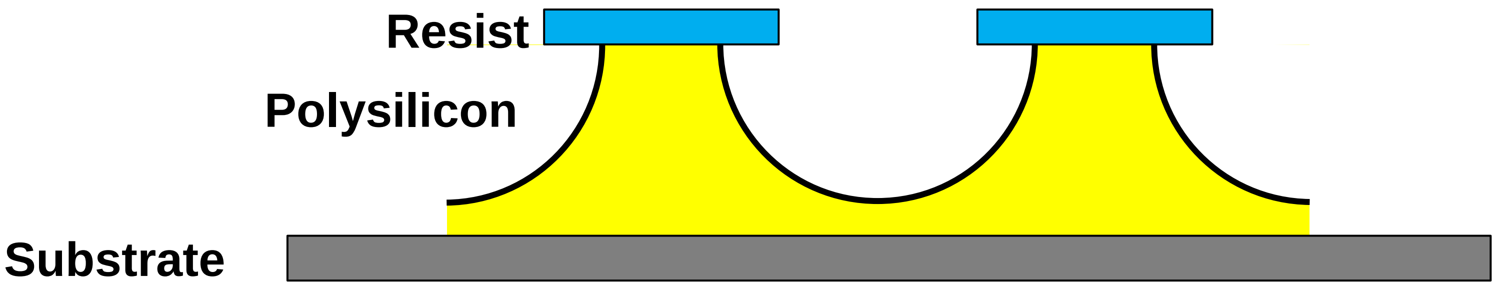
A semiconductor device is fabricated by many repetitive production process



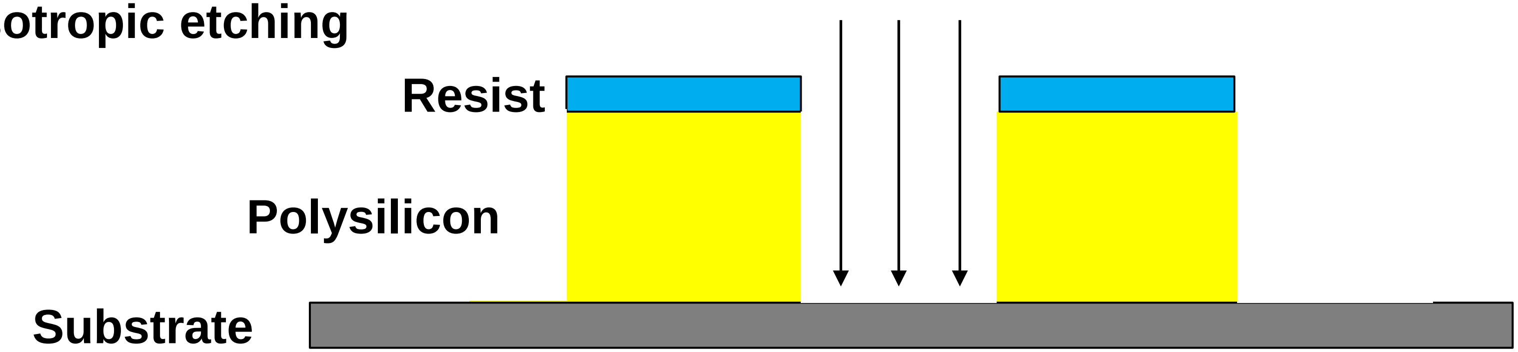
Surf. Topogr.: Metrol. Prop. **4** (2016) 023001

There are two types of etching: isotropic vs anistropic

- Isotropic etching



- Anisotropic etching



Comparison of different processes

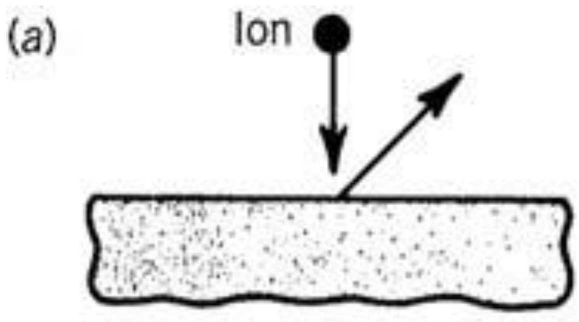
	Sputtering etching	Pure chemical etching	Ion energy-driven etching	Ion-enhanced Inhibitor etching
Selectivity	X	O	O	O
Anisotropic	O	X	O	O
Volatile product	X	O	O	O

TABLE 15.1. Etch Chemistries Based on Product Volatility

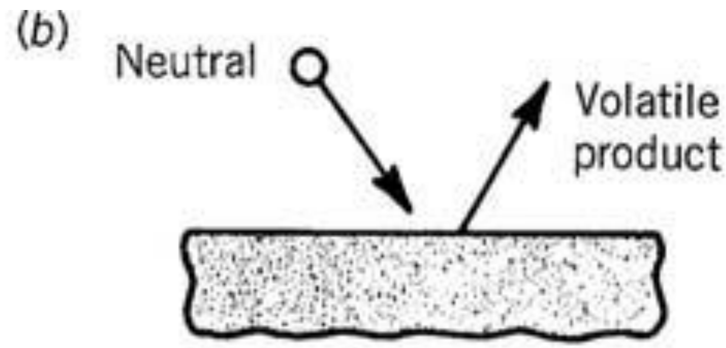
Material	Etchant Atoms
Si, Ge	F, Cl, Br
SiO_2	F, F + C
Si_3N_4, silicides	F
Al	Cl, Br
Cu	Cl ($T > 210°C$)
C, organics	O
W, Ta, Ti, Mo, Nb	F, Cl
Au	Cl
Cr	Cl, Cl + O
GaAs	Cl, Br
InP	Cl, C + H

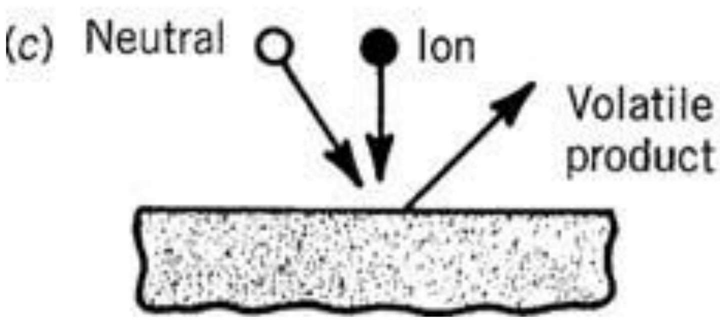
There are four major plasma etching mechanisms

- **Sputtering**

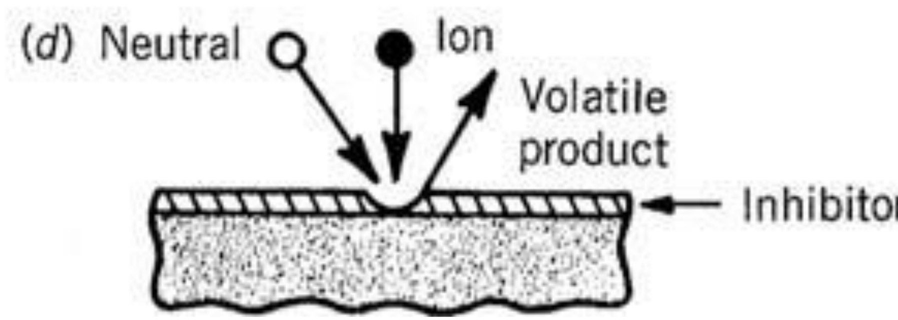


- **Pure chemical etching**





- **Ion energy-driven etching**



- **Ion-enhanced inhibitor etching**

Principles of plasma discharges and materials processing, 2nd edition, by Michael A. Lieberman and Allan J. Lichtenberg

Comparison of different processes

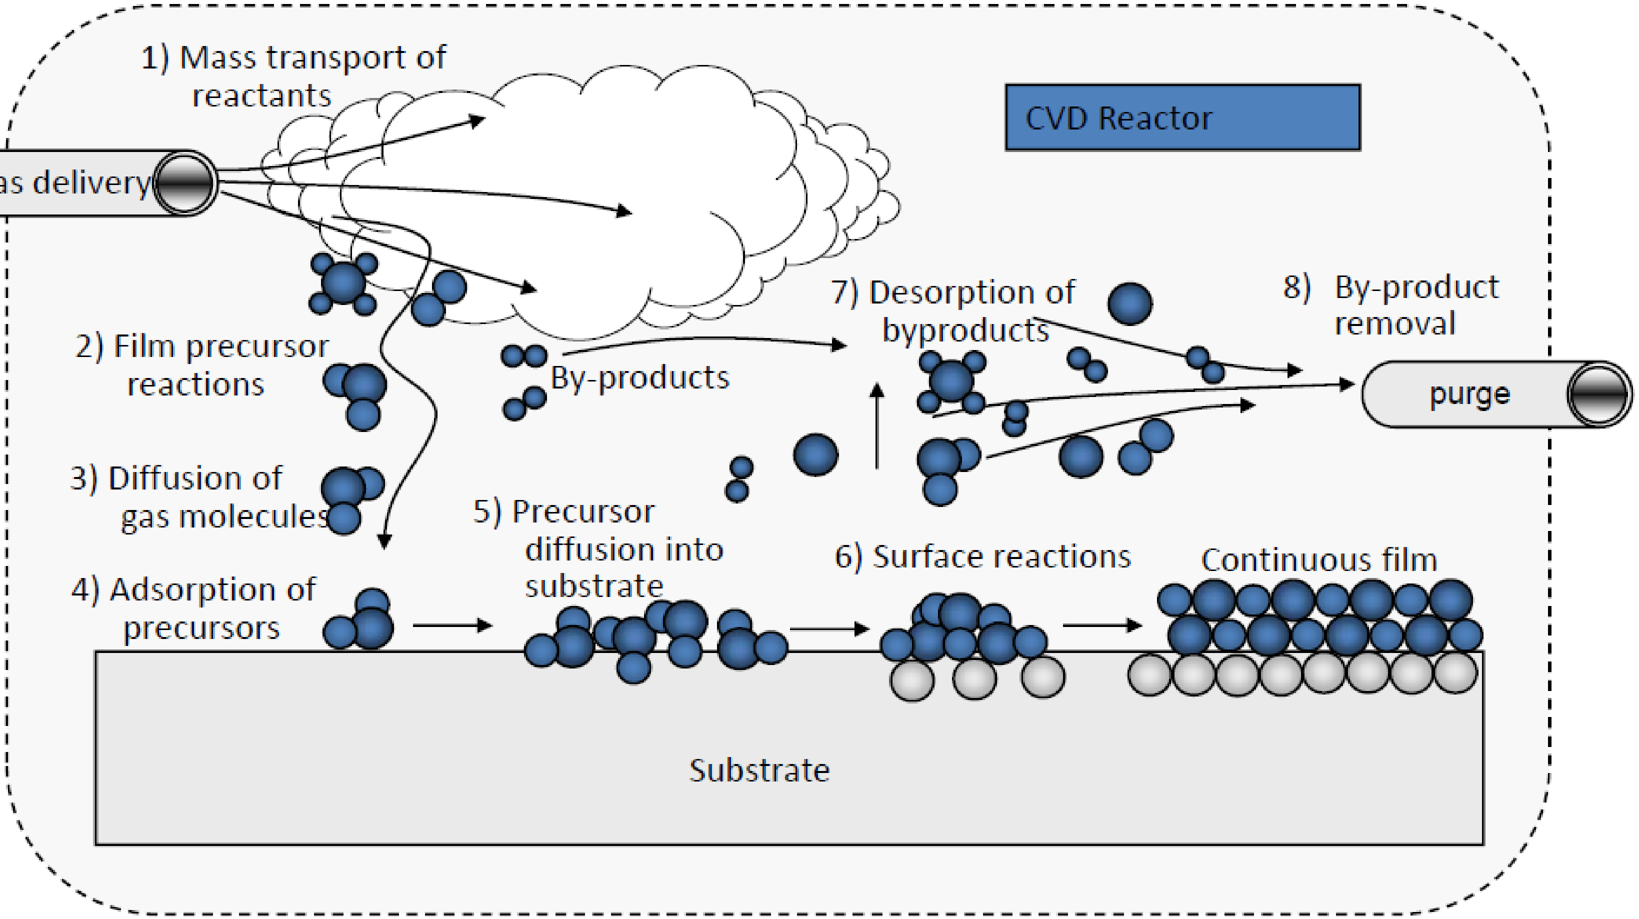
Deposition and implementation

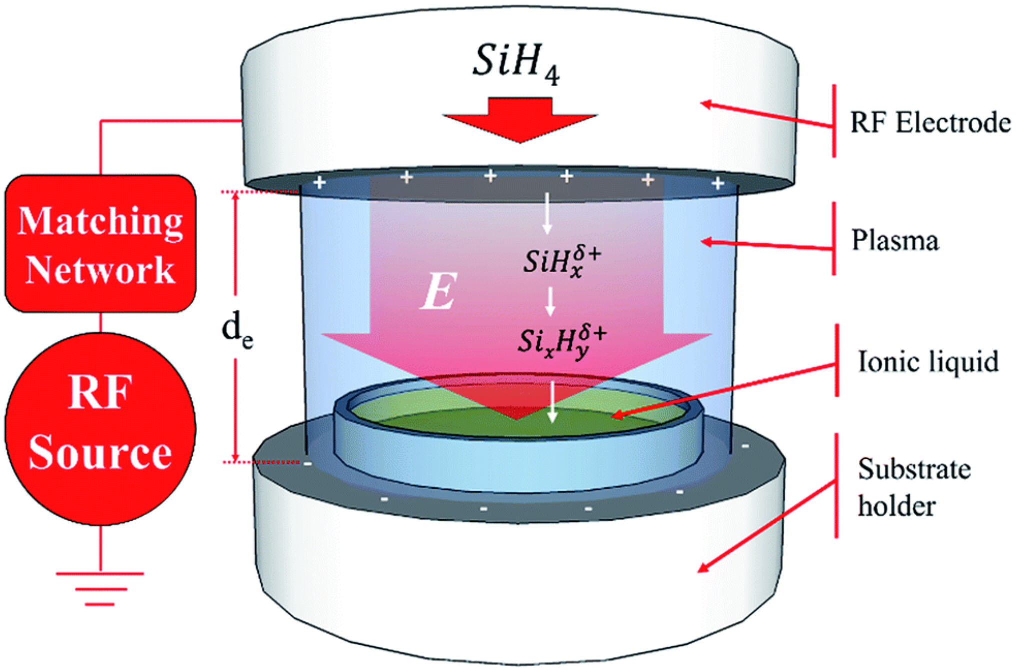
- **Plasma-assisted deposition, implantation, and surface modification are important material processes for producing films on surfaces and modifying their properties**
- **Example processes:**
  – **Plasma-enhanced chemical vapor deposition (PECVD)**
  – **Sputter deposition / physical vapor deposition (PVD)**
  – **Plasma-immersion ion implantation (PIII)**

PECVD

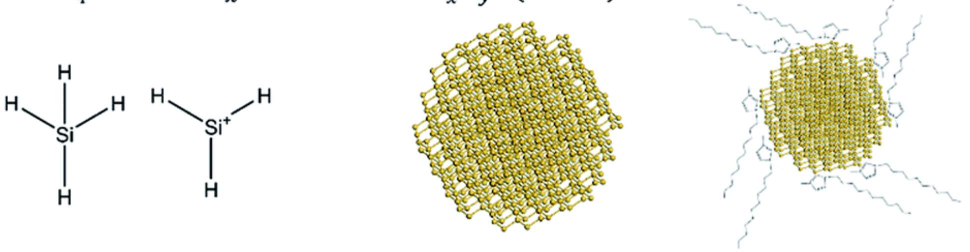
Chemical Vapor Deposition (CVD)



Plasma-enhanced chemical vapor deposition (PECVD)



$$SiH_4 \xrightarrow{plasma} SiH_x^{\delta+} \xrightarrow{Intercollision} Si_xH_y^{\delta+}(SiNPs) \xrightarrow{ILs} Stablized\ SiNPs$$



Films can be deposited in low temperatures using plasma deposition

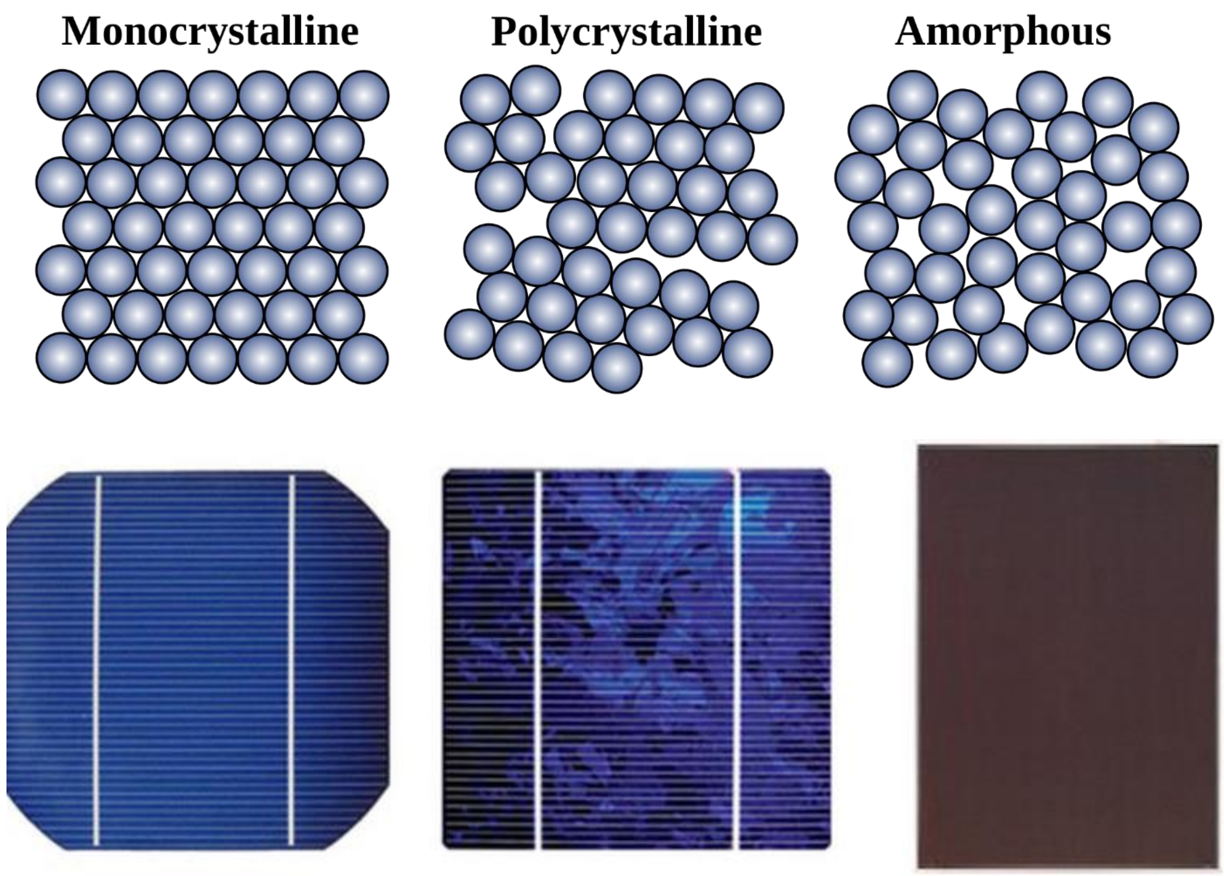
- **Device structures are sensitive to temperature, high-temperature deposition processes cannot be used in many cases.**
- **High-temperature films can be deposited at low temperatures.**
- **Unique films not found in nature can be deposited, e.g., diamond.**

Working temperature is determined by the desired film properties

- CVD – consists of a thermally activated set of gas-phase and surface reactions that produce a solid product at a surface.
- PECVD – gas-phase and the surface reactions are controlled or modified by the plasma properties.
- Te~2-5 eV in PECVD is much greater than the substrate temperature, the temperature in PECVD is much less that CVD.
- Deposition rates are usually not very sensitive to the substrate temperature T.
- Film properties such as composition, stress, and morphology, are functions of T.
- Low-temperature PECVD films are amorphous, not crystalline, which can more easily be achieved with chemical vapor deposition (CVD).

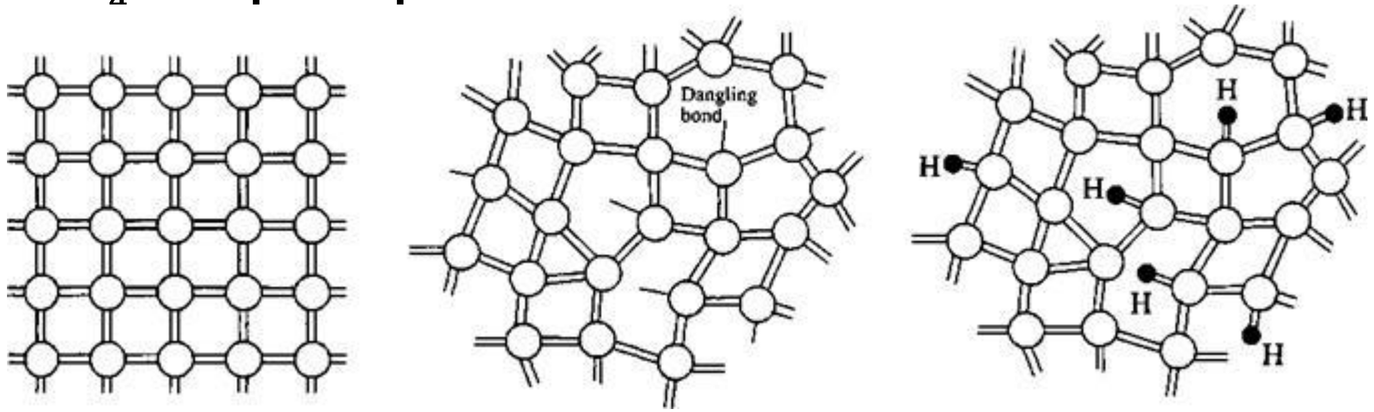
Example of using PECVD – amorphous silicon

- **Amorphous silicon thin films are used in solar cells**



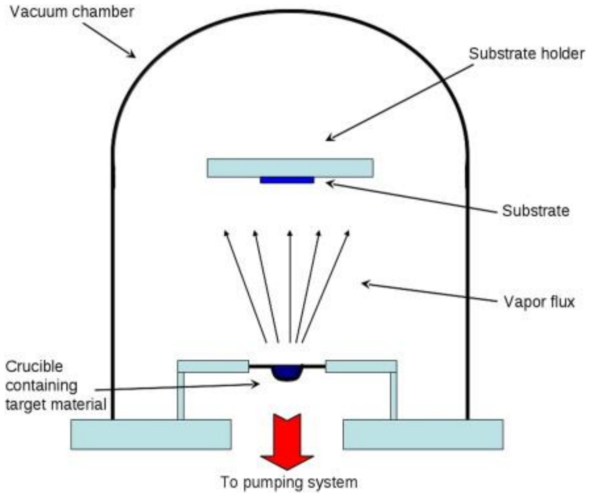
Example of using PECVD – amorphous silicon

- H is required so that SiH_4 is used
  - For the material to be semiconducting.
  - Terminate the dangling bonds.
  - The dangling bonds are created by ion bombardment (SiH_3^+) which also removes hydrogen from the surface.
  - SiH_3 and SiH_2 radicals are important precursors for film growth while SiH_4 also participates in surface reactions.

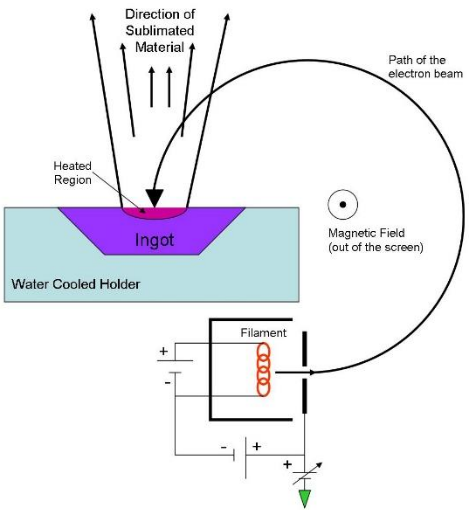


Physical vapor deposition can be achieved by heating the deposited material

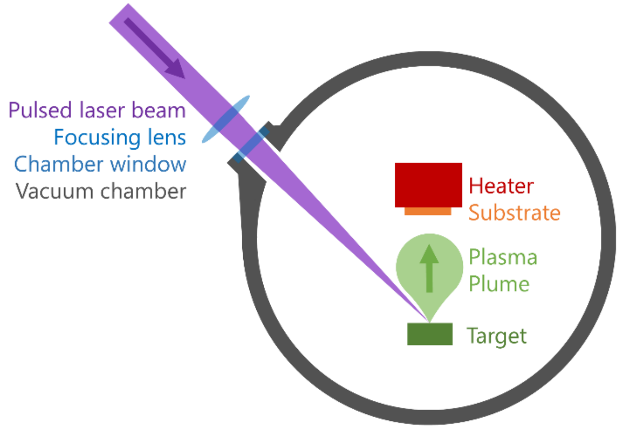
- **Thermal evaporator**



- **Electron-beam evaporator**

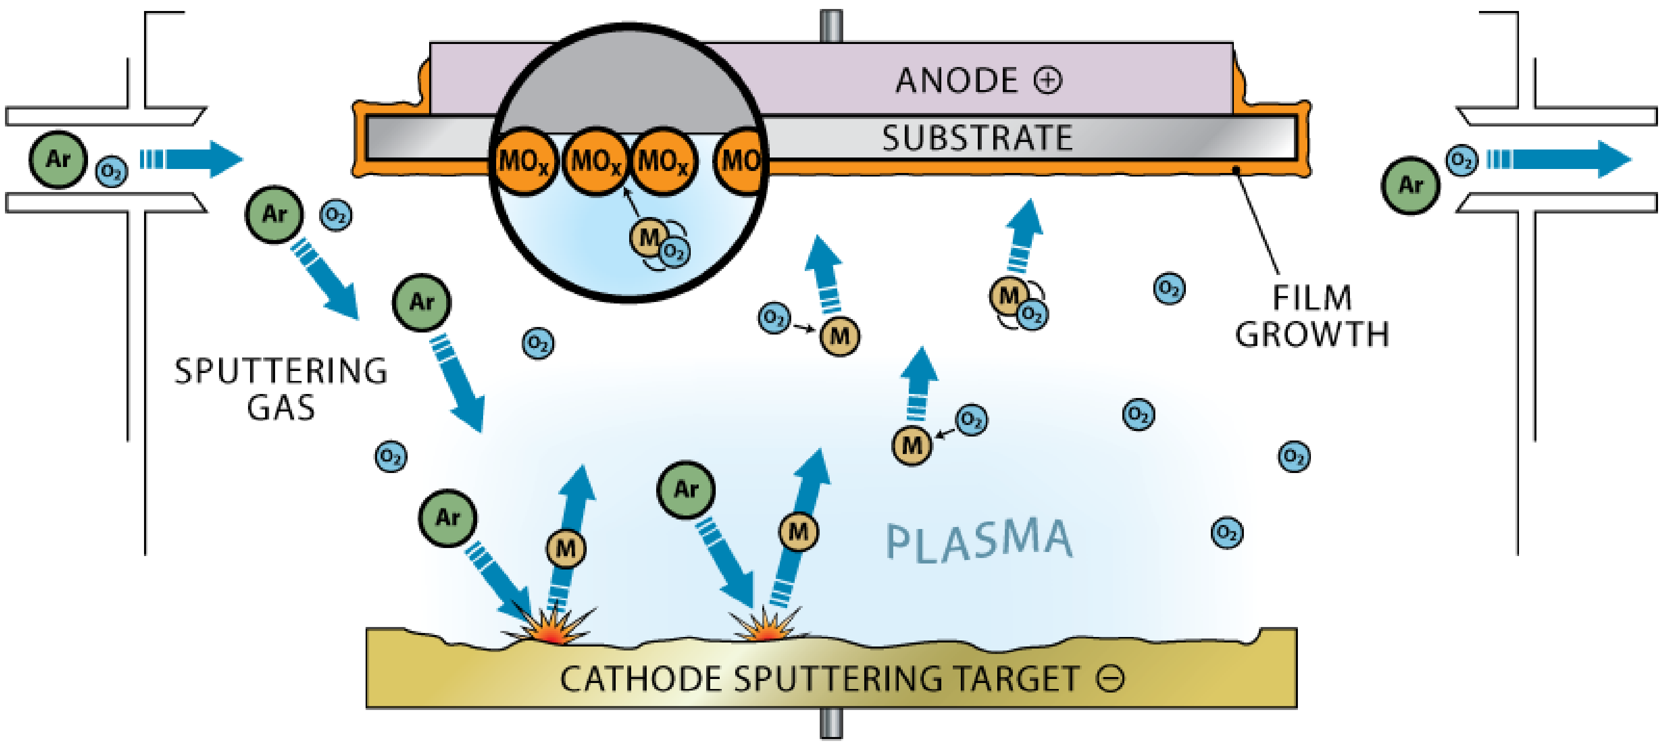


- **Pulsed-laser deposition**



https://en.wikipedia.org/wiki/Pulsed_laser_deposition
Engineered biomimicry by A. Lakhtakia and R. J. Martin-Palma
https://en.wikipedia.org/wiki/Electron-beam_physical_vapor_deposition

Sputtering deposition

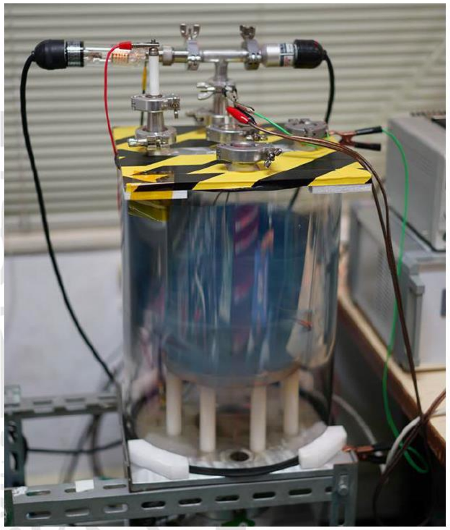


http://lnf-wiki.eecs.umich.edu/wiki/Sputter_deposition

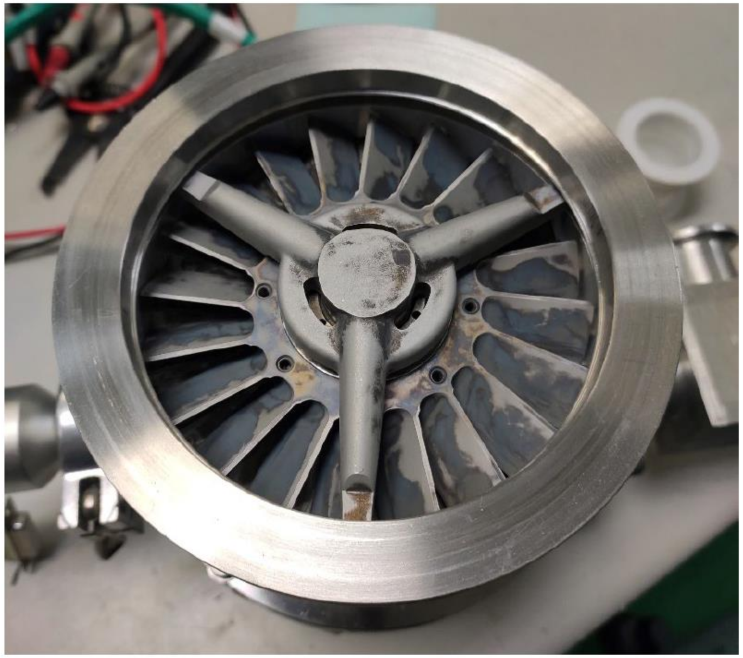
The chamber becomes very dirty after the deposition process

- **Before**

- **After**

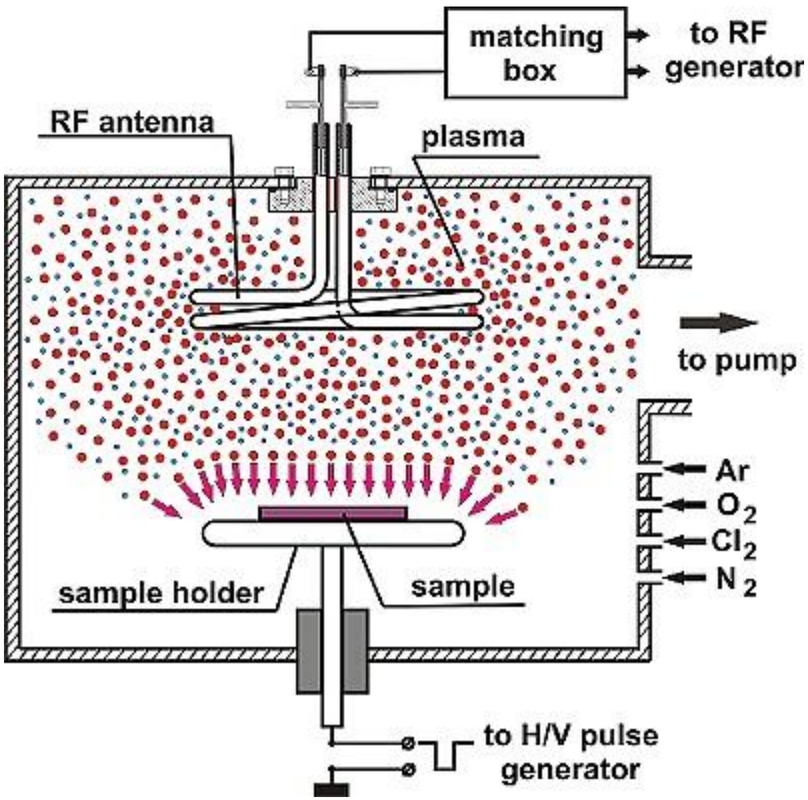


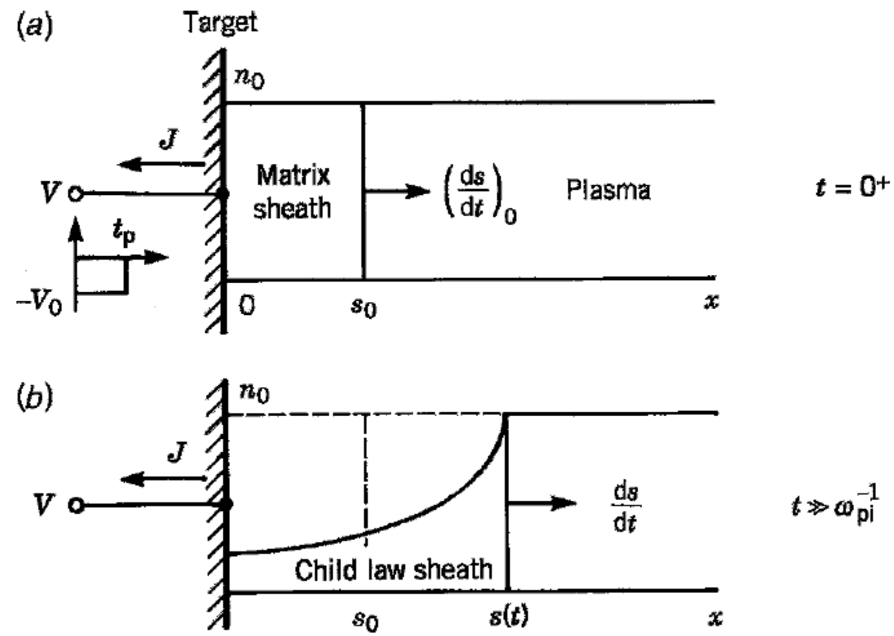
- **The turbomolecular pump is also very dirty after the process.**



PIII

Plasma-immersion ion implantation (PIII)

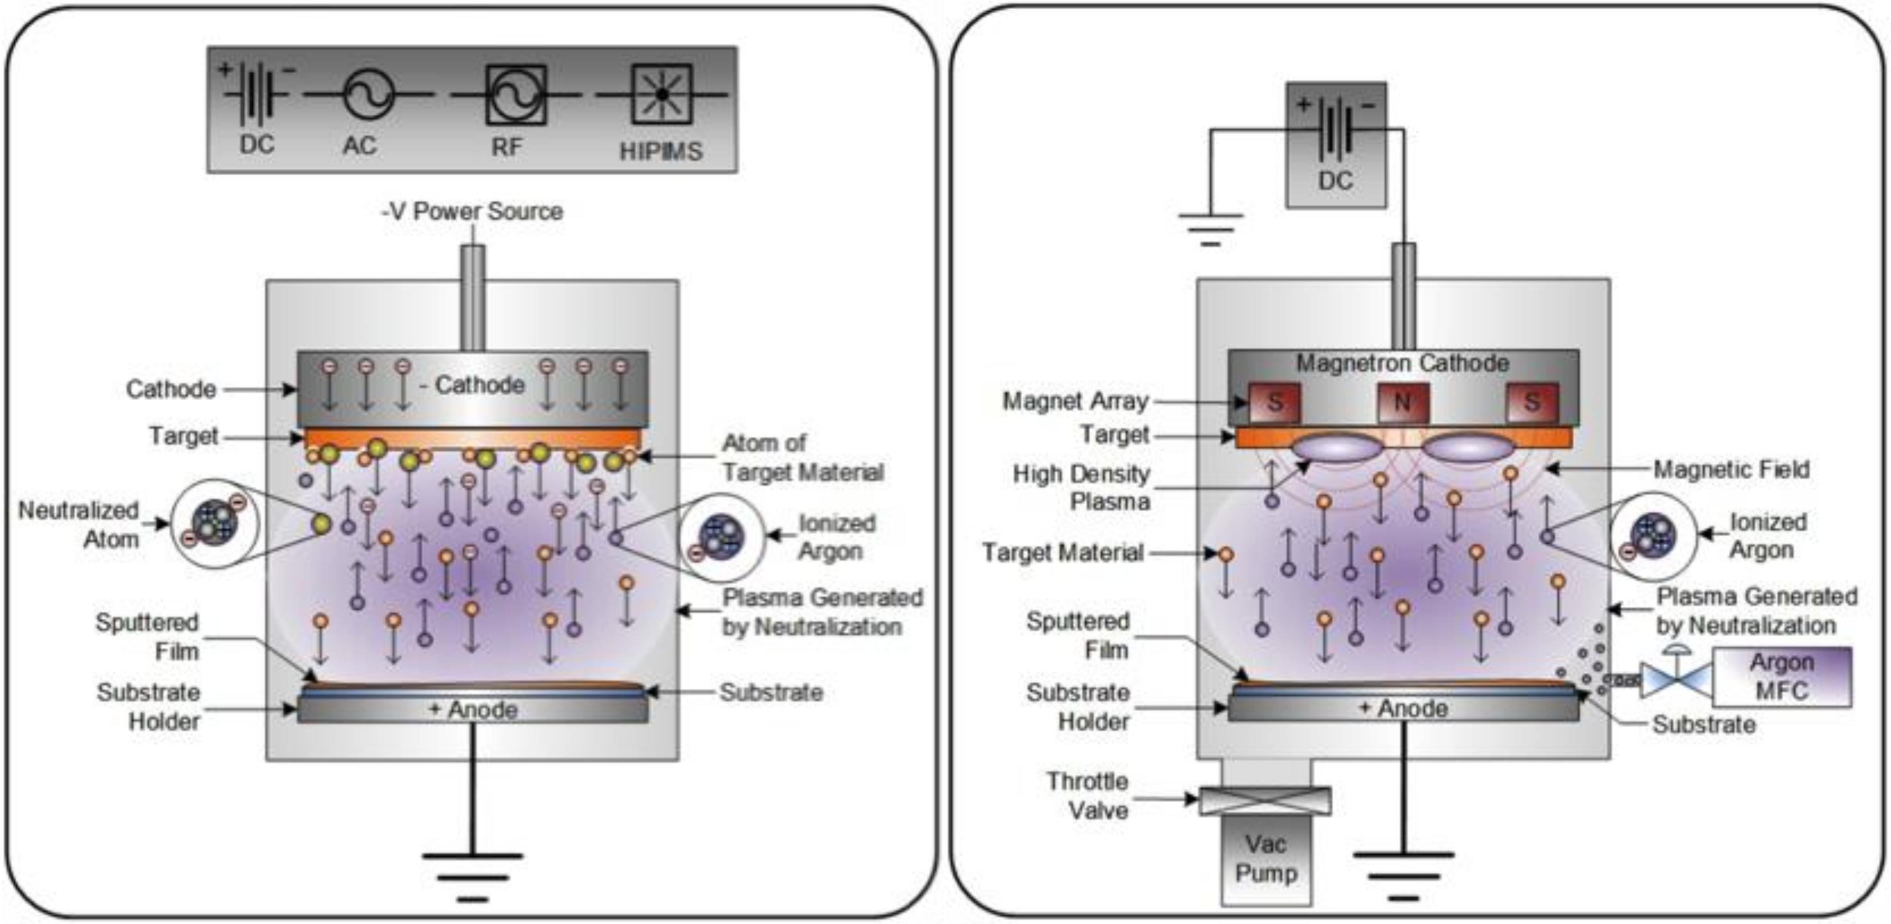




- **Silicon doping – ions such as B, P, As are implanted**
- **Surface hardening of metals – N, C are implanted**

https://www.hzdr.de/db/Cms?pOid=10890&pNid=306

Magnetron sputtering provides higher deposition rates than conventional sputtering



http://www.semicore.com/what-is-sputtering

Examples of magnetron sputtering deposition

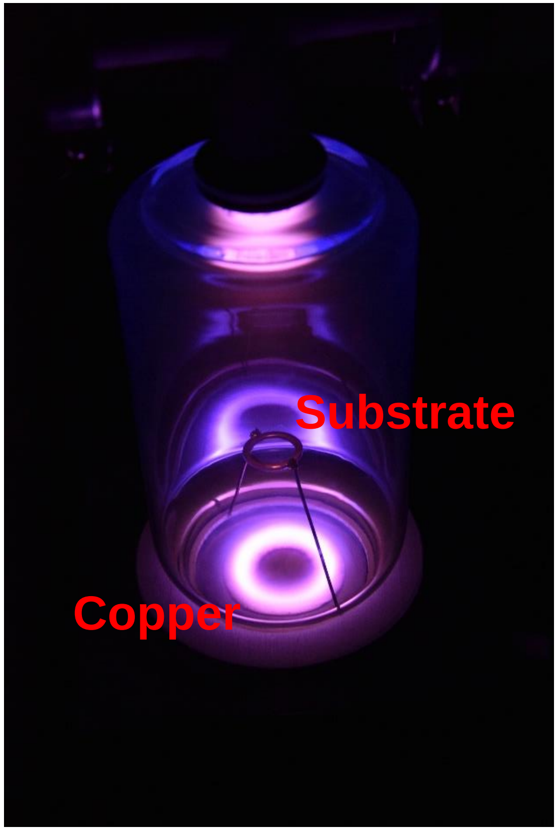
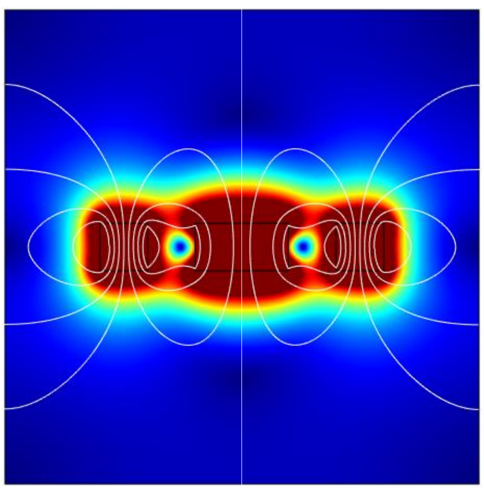
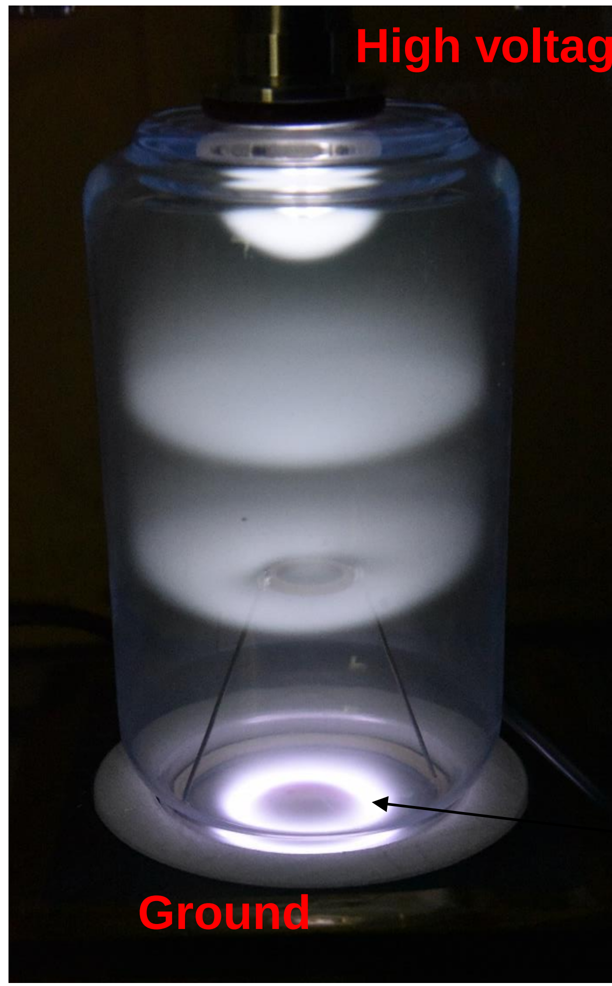
- With magnet



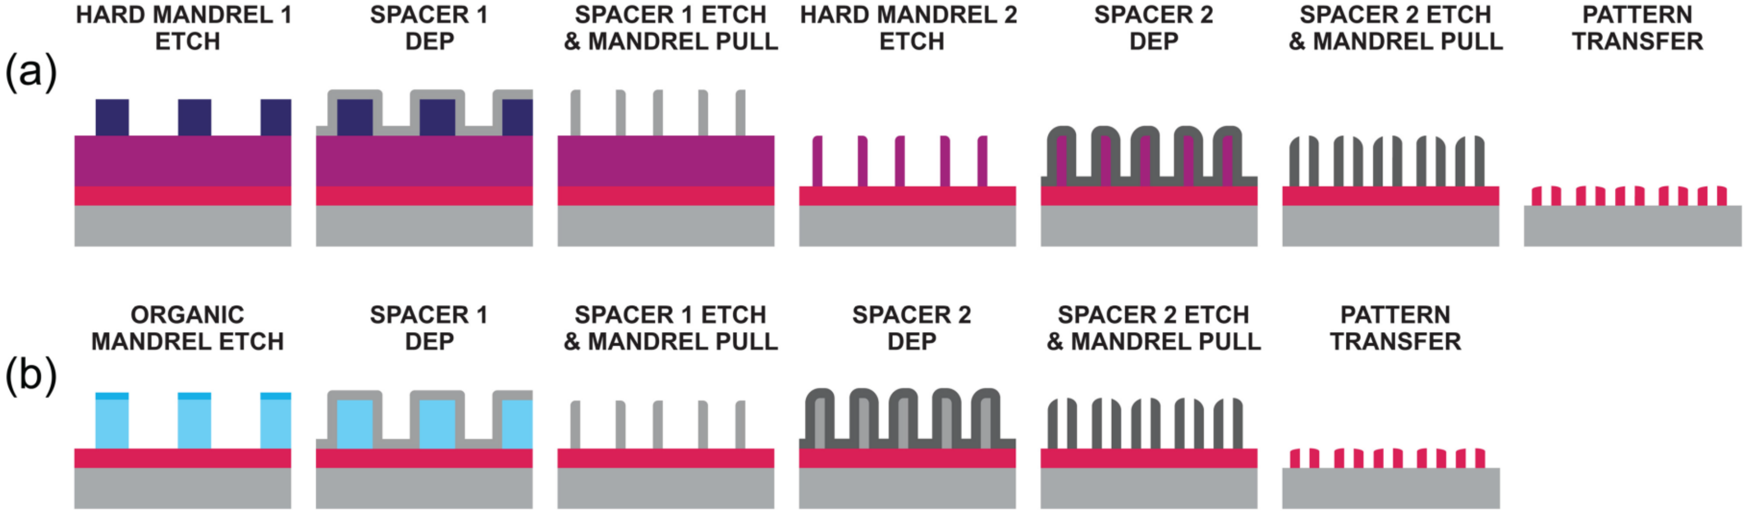
A bright ring occurs when the magnet is inserted into the system





Confined electrons

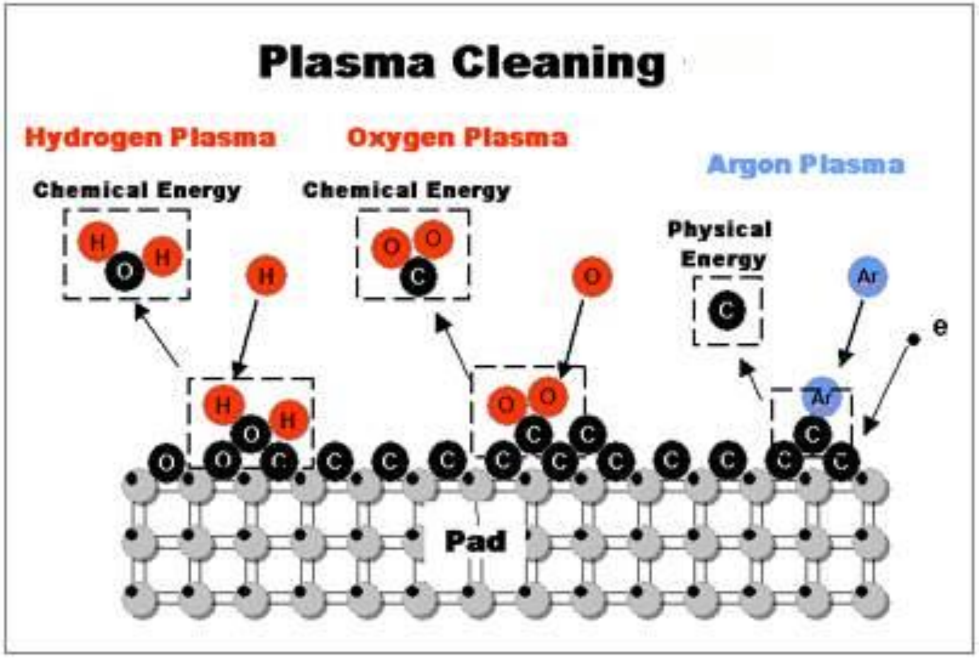
self-aligned quadruple patterning



H. C. M. Knoops *et al.*, J. Vac. Sci. Technol. **A 37**, 030902 (2019)

Plasma can be used for cleaning surface

- **Cleaning mechanisms:**
  - **Chemical reactions by free radicals**
  - **Physical sputtering by high energy ions**



Free radicals are generated and used in chemical reactions

$$e^- + H_2 \rightarrow 2H\bullet \qquad e^- + O_2 \rightarrow 2O\bullet \qquad \mathrm{O}\bullet + O_2 \rightarrow O_3$$

- **Highly reactive free radicals generated in plasma may react with the hydrocarbon contaminants of surface oxide.**
- **Both H• and O• can react with grease or oil on surface to form volatile hydrocarbons.**

$$\mathrm{H}\bullet_{(g)} + C_nH_{2n+2(s)} \rightarrow \mathrm{CH}_{4(s)}$$

$$\mathrm{O}\bullet_{(g)} + C_nH_{2n+2(s)} \rightarrow \mathrm{CO}_{(s)} + \mathrm{CH}_xO_{y(g)} + H_2O_{(g)}$$

- **O• is more reactive than H•. But O• may also react with surface metal to form oxide, deteriorating the material properties. Nevertheless, H• can make metal oxide back to metal.**

$$\mathrm{O}\bullet + \mathrm{Me} \rightarrow \mathrm{MeO}$$

$$\mathrm{H}\bullet + \mathrm{MeO} \rightarrow \mathrm{Me} + H_2O$$

The effect of chemical reactions is increased as the pressure increases

- **Advantages:**
  - **Stable gas products are formed.**
  - **No redeposition problem.**
  - **High etching selectivity.**

- **Disadvantages:**
  - **Higher concentration of H_2 or O_2 is required to ensure an appropriate etching rate.**
  - **H_2 safety or O_2 strong oxidation ability needs to be monitored.**

High energy ions are used in physical sputtering cleaning

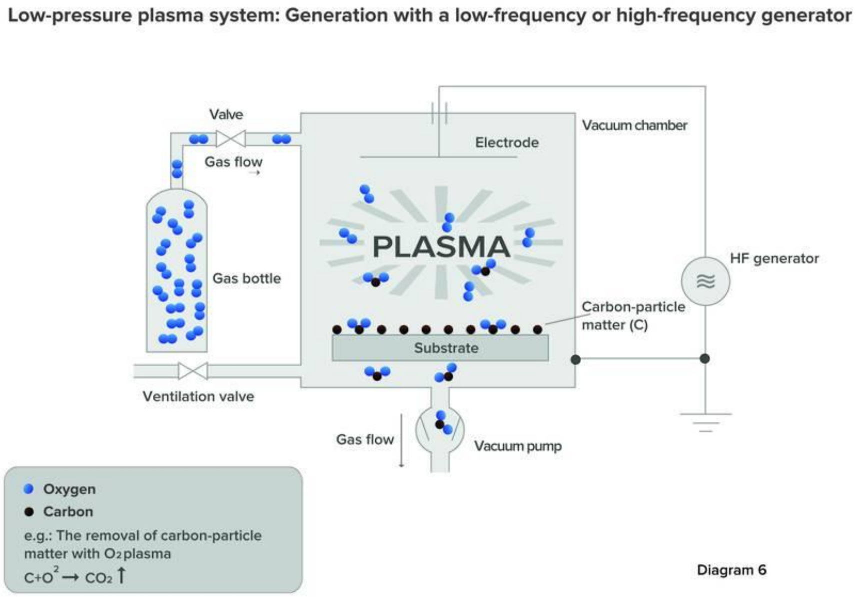
- Ions generated in plasma can be accelerated toward the substrate to physically bombard away the atoms of contaminants.
- The physical sputtering rate increases as the following quantities increase:
  - Plasma density;
  - Accelerating voltage;
  - Mass of bombardment atoms.
- The physical sputtering is also enhanced by lowering the pressure.
- High cathode bias is used.
- Ar^+ has strong sputtering effect.

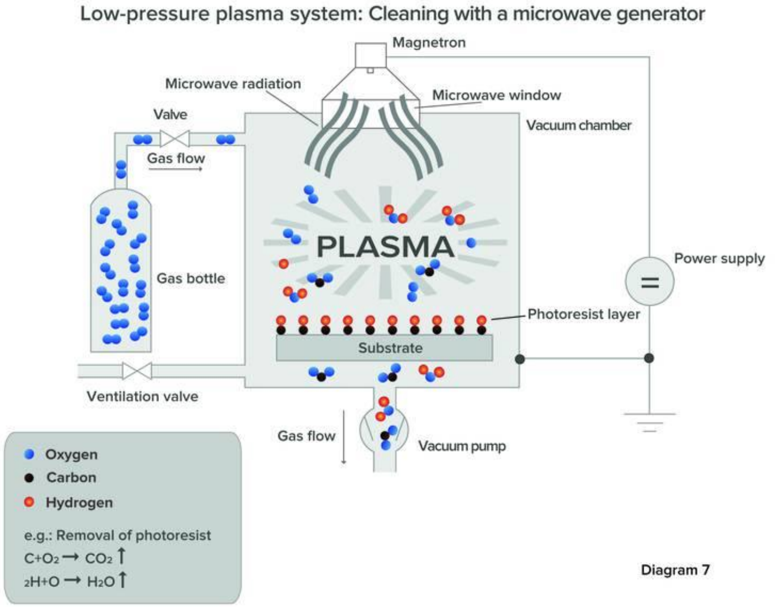
The physical sputtering rate increases with higher cathode bias and Ar concentration and lower pressure

- **Advantages:**
  - **Highly efficient cleaning effect can be achieved.**
  - **Gas consumption rate can be very low.**

- **Disadvantages:**
  - **Etching problems – non-selective etching by physical sputtering.**
  - **Redeposition problems: the products sputtered out may be highly unstable and tend to deposit again downstream.**

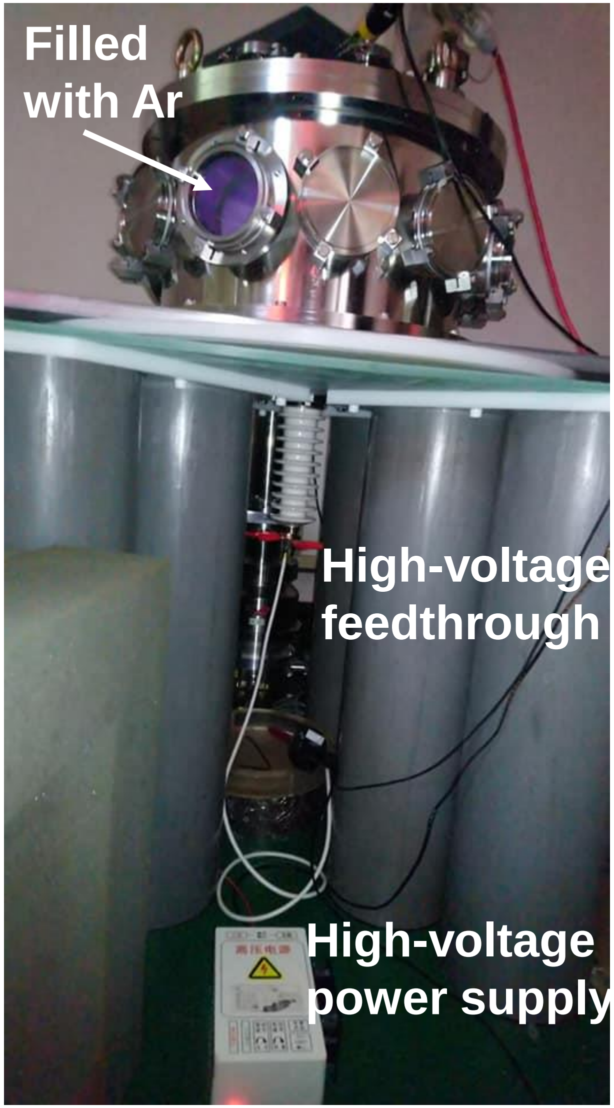
Plasma cleaning examples



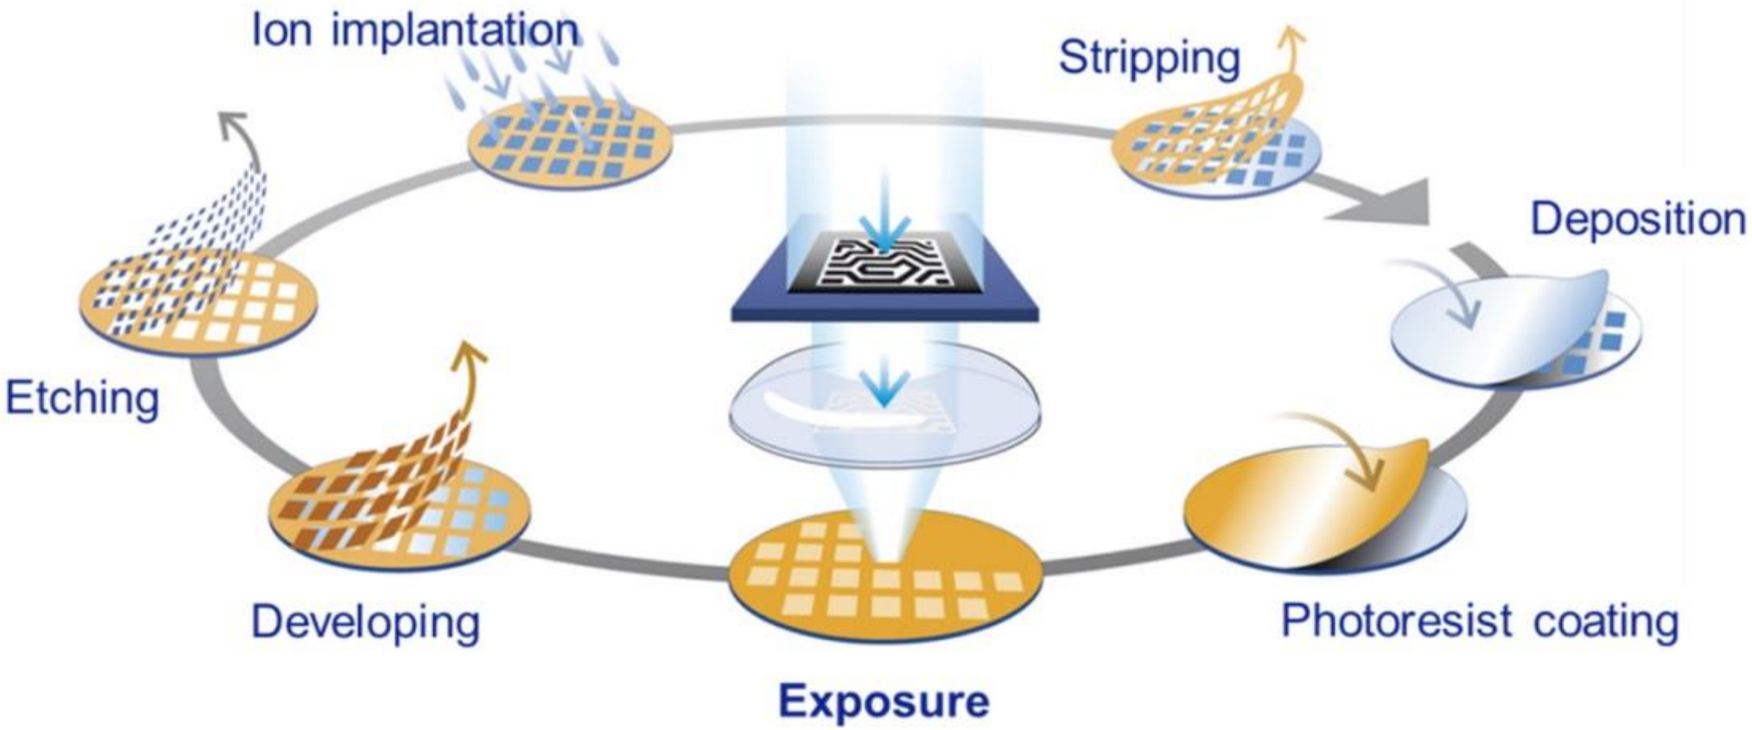


https://www.plasma.com/en/plasmatechnik/low-pressure-plasma/cleaning/

Plasma cleaning needs to work in the regime of abnormal glow discharge



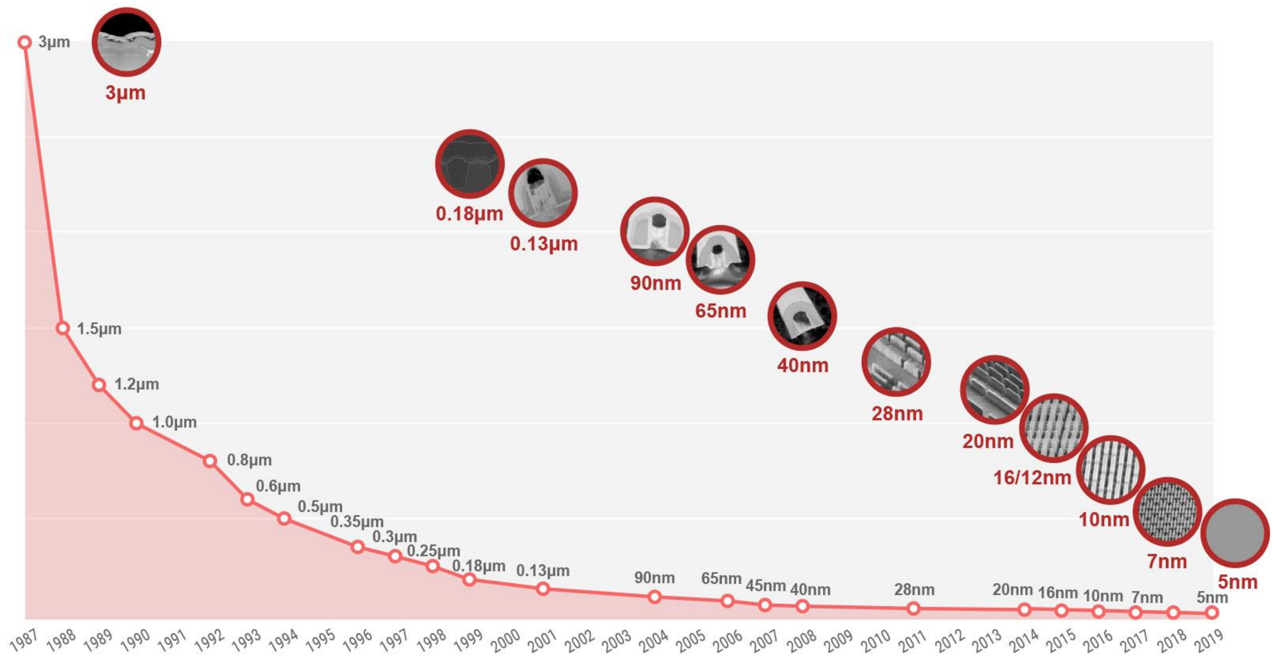
A semiconductor device is fabricated by many repetitive production process



Surf. Topogr.: Metrol. Prop. **4** (2016) 023001

Ultraviolet lithography (EUVL) is one of the key technologies in semiconductor manufacturing nowadays

- **The process technology of Taiwan Semiconductor Manufacturing Company Limited (TSMC):**

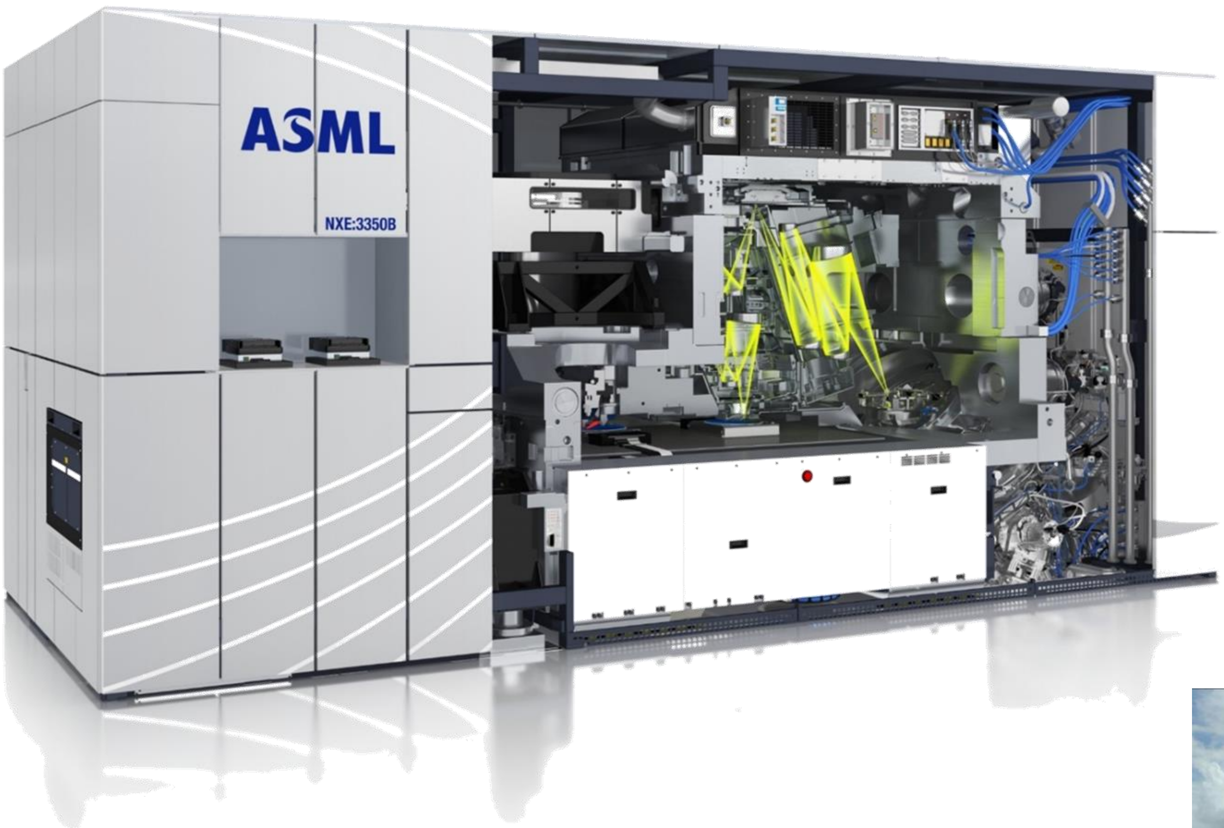


- **Optical diffraction needs to be taken into account.**
- **Shorter wavelength is preferred.**

- **Light source with a center wavelength of 13.5 nm is used.**

https://www.tsmc.com/chinese/dedicatedFoundry/technology/logic.htm

EUV lithography becomes important for semiconductor industry

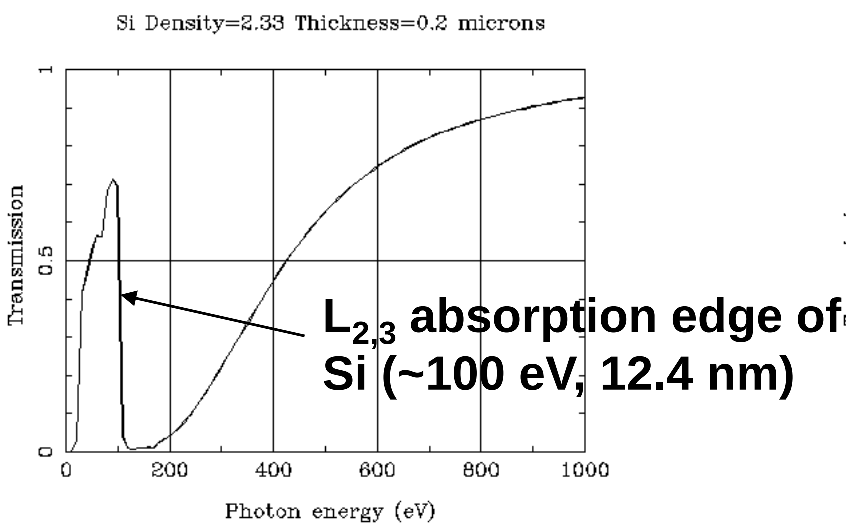


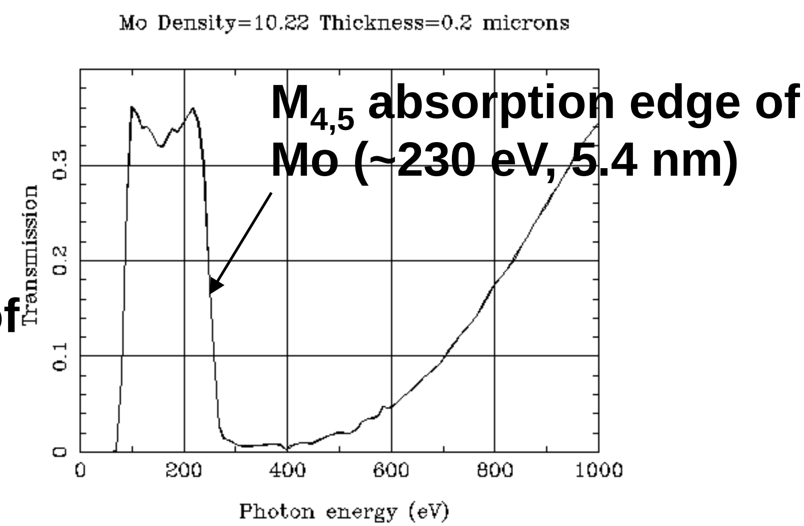
- **0.15 billion USD for each EUV light source.**

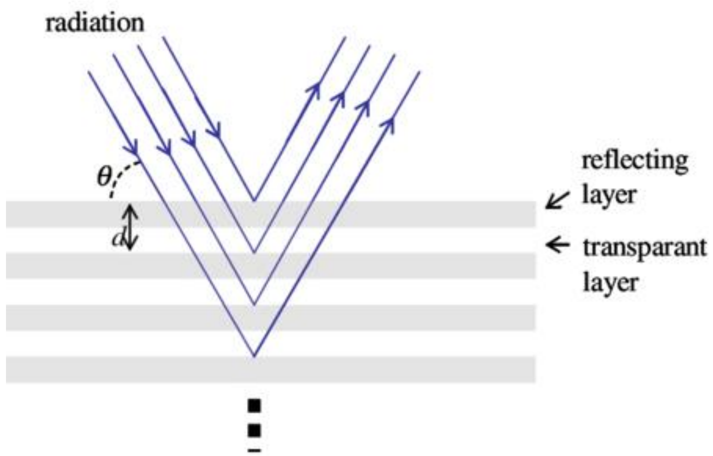
https://www.youtube.com/watch?v=NHSR6AHNiDs

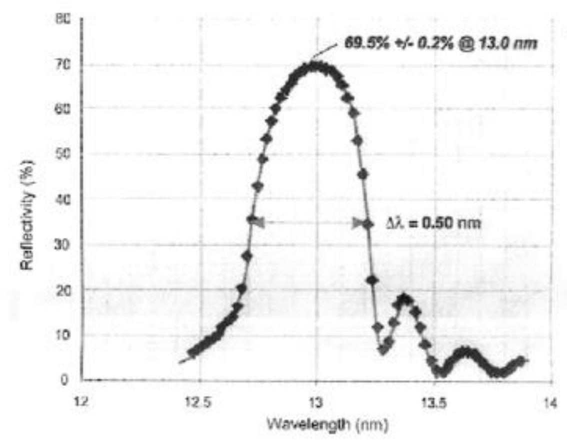
http://finance.technews.tw/2019/01/25/euv-asml-2018/

EUV light can only be reflected using multilayer mirrors



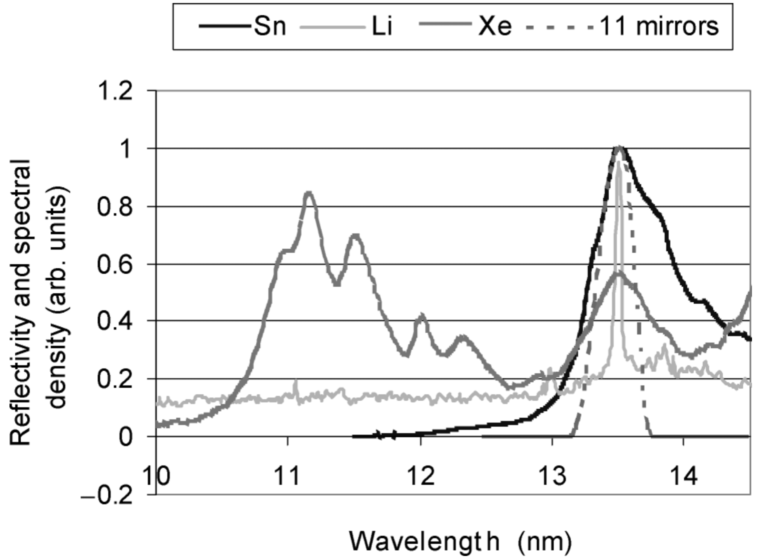






https://henke.lbl.gov/optical_constants/
Mo/Si multilayer coating technology for EUVL, coating uniformity and time stability; E. Louis et al.; SPIE 4146-06, Soft X-ray and EUV Imaging Systems, San Diego, 2000.

13.5-nm EUV light is picked for EUV lithography



- $\lambda = 13.5\ \mathrm{nm} \pm 1\%$ **is required.**
- **At T=35-40 eV (~450,000 K), in-band emission occurs.**
- **Xenon:**
  - $4p^6 4d^8 \rightarrow 4p^6 4d^7 5p$ **from single ion stage** Xe^{10+}
  - **UTA @ 11 nm**
- **Tin:**
  - $4p^6 4d^N \rightarrow 4p^5 4d^{N+1} + 4p^6 4d^{N-1} 4f$ $(1 \leq N \leq 6)$ in ions ranging from Sn^{8+} to Sn^{12+}
  - **UTA @ 13.5 nm**
- UTA: unresolved transition array

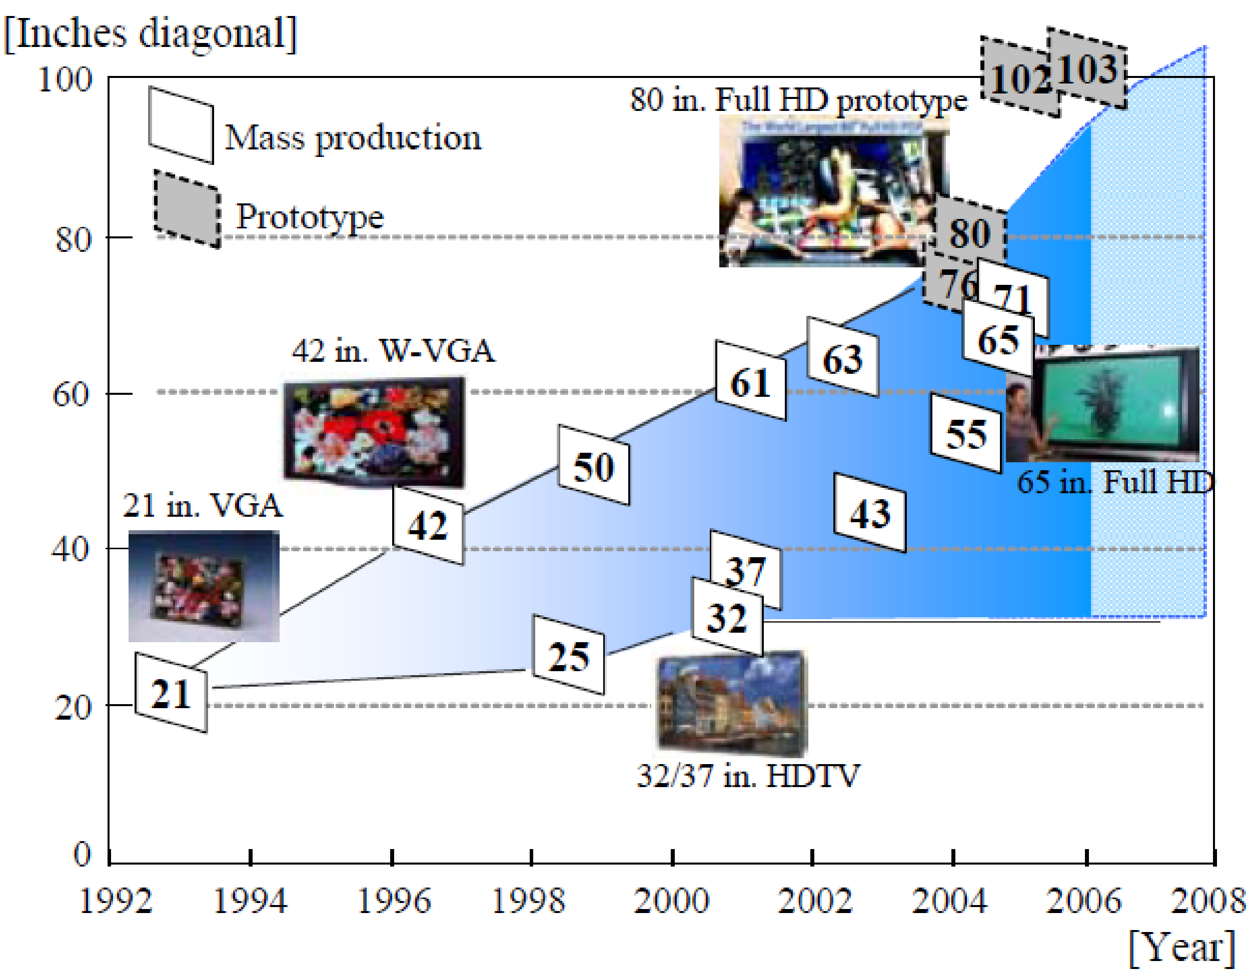
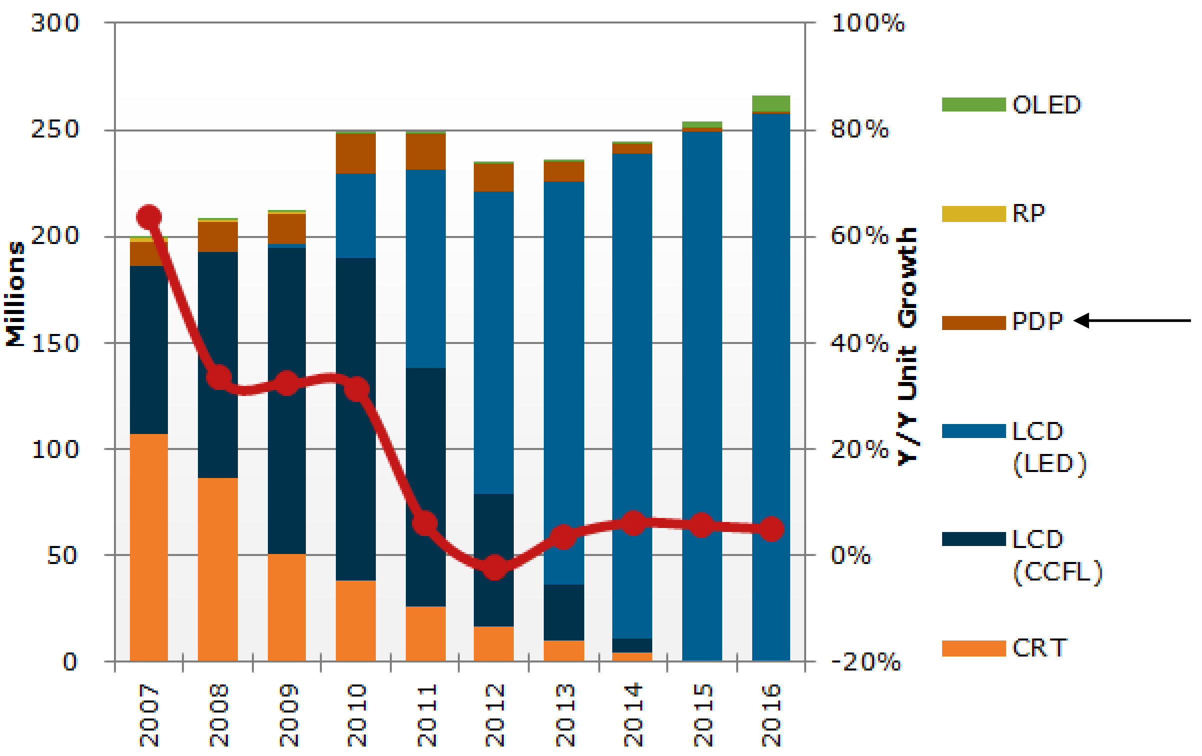
Optimistic projection of PDP market



Reality

TV Shipment Growth by Technology



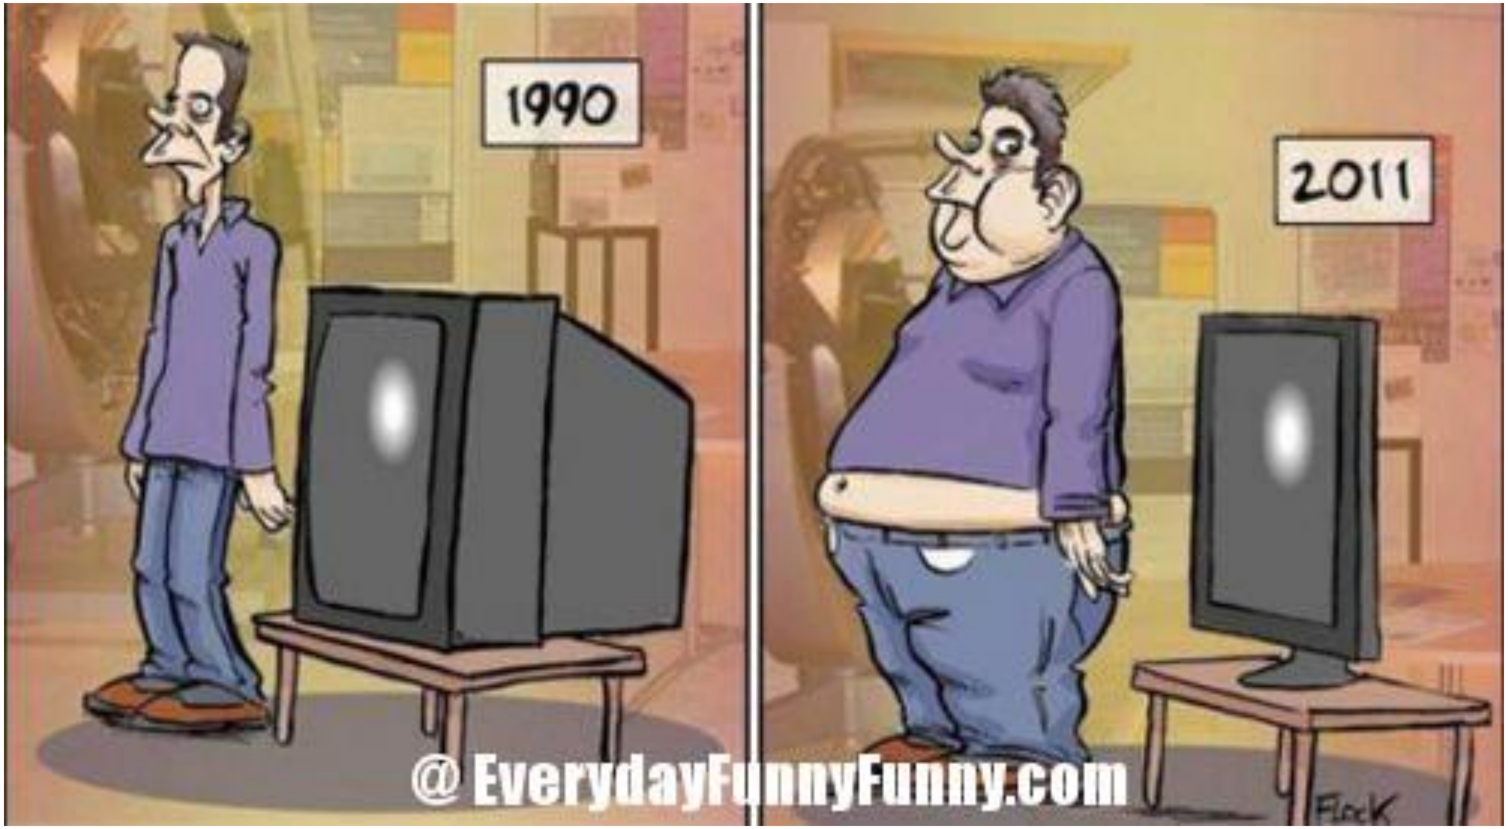
http://www.digitaltvnews.net/?p=22108

Too many reasons that PDP died!

- Bright showroom conditions put plasmas at a distinct disadvantage versus LED-lit LCDs
- Aesthetics may have played a role in hastening plasma's demise
- UHD/4K caught on quickly
- Screen-size limitations also played a part in plasmas plight
- You can't bend a plasma
- Plasmas were harder to deal with than LCDs
- While OLED is still in the early stages of development, there's no question it offers greater potential than plasma
- Energy efficiency may have played a part in putting plasma out to pasture
- Plasma was the original flat-panel technology, People just thought of it as old technology.
- Projectors improved in quality and prices dropped

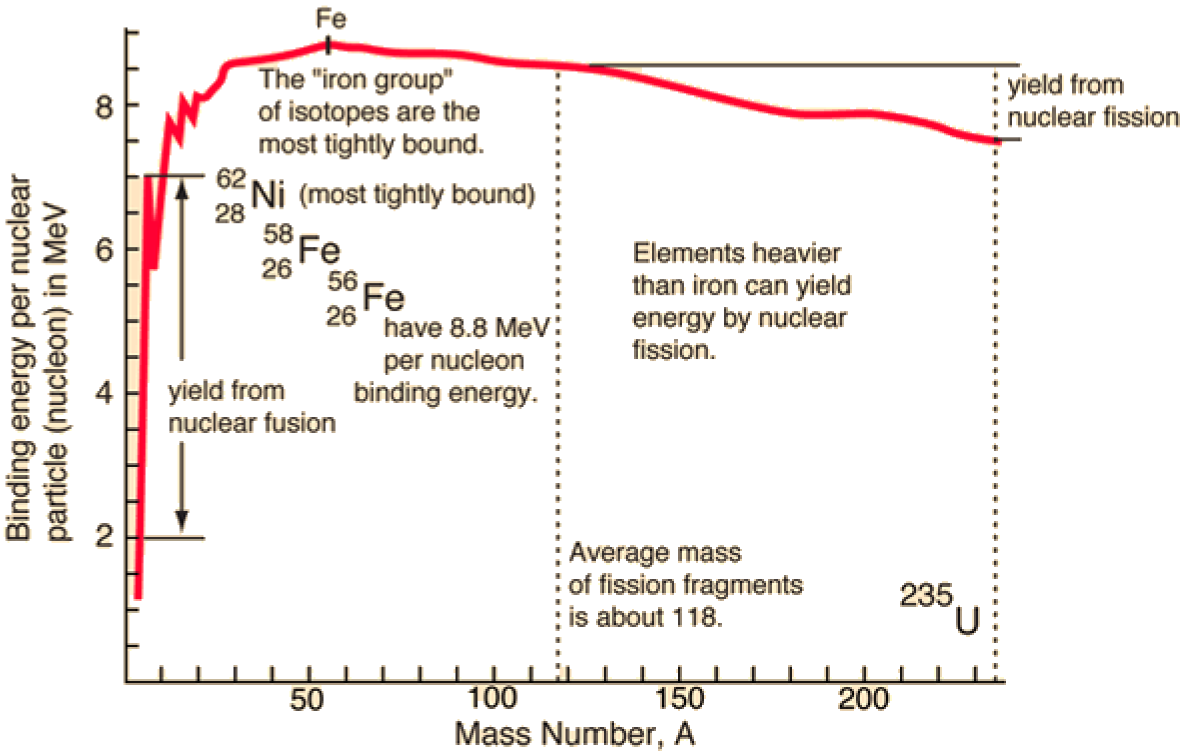
http://www.avsforum.com/forum/40-oled-technology-flat-panels-general/2080650-10-reasons-plasma-died.html

Let’s stand up and do exercise!!



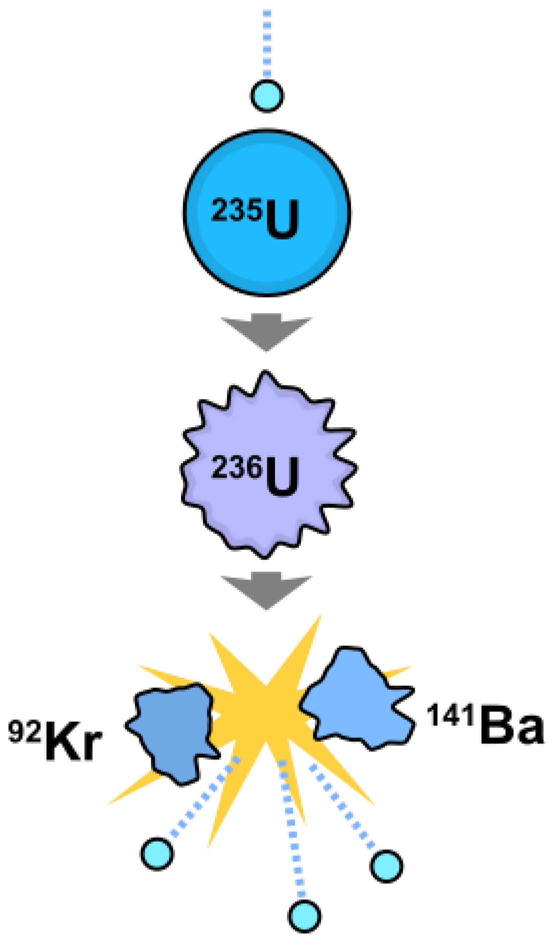
The hydrogen bomb

The “iron group” of isotopes are the most tightly bound



http://hyperphysics.phy-astr.gsu.edu/hbase/nucene/nucbin.html

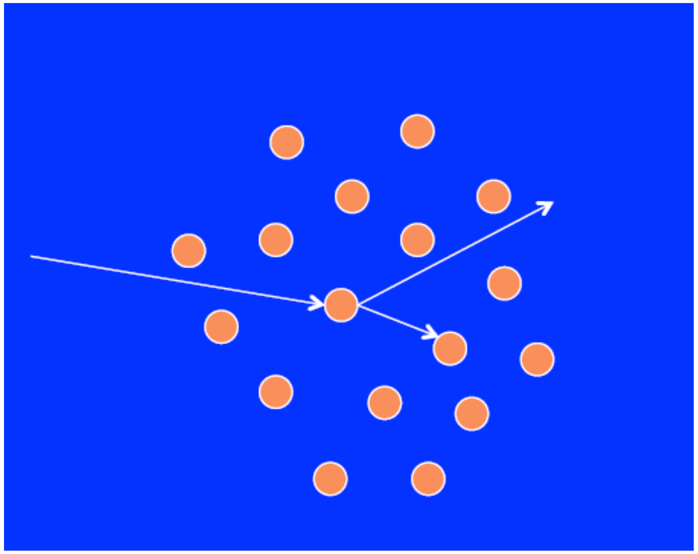
Chain reaction can happen in U^{235} fission reaction



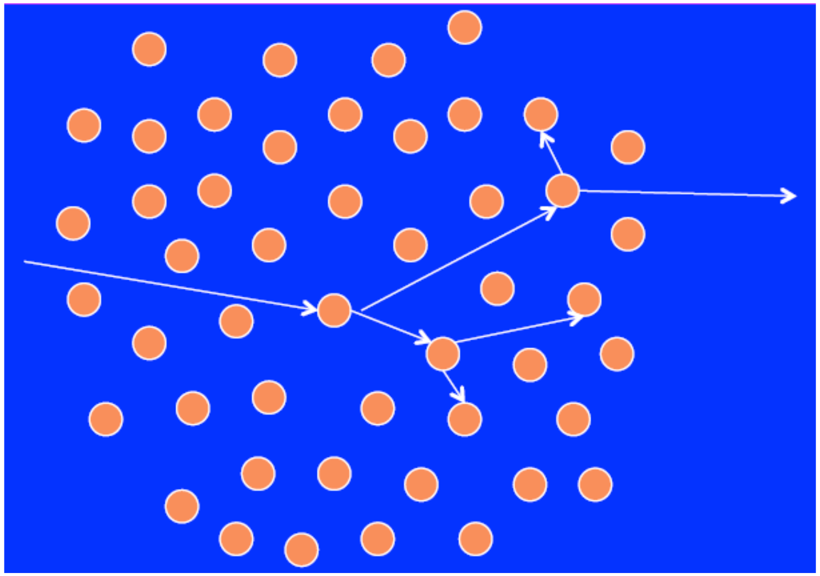
- ~ 200 million electron volts (MeV)/fission, ~million times more than chemical reactions
- Energy for bombs, or for civilian power can generate huge amounts of energy (and toxicity) in a small space with a modest amount of material
- Source of safety, security issues for nuclear power

https://en.wikipedia.org/wiki/Uranium-235
Talk given by Matthew Bunn, IGA-232: Controlling the World's Most Dangerous Weapons, Harvard Kennedy School, 2013

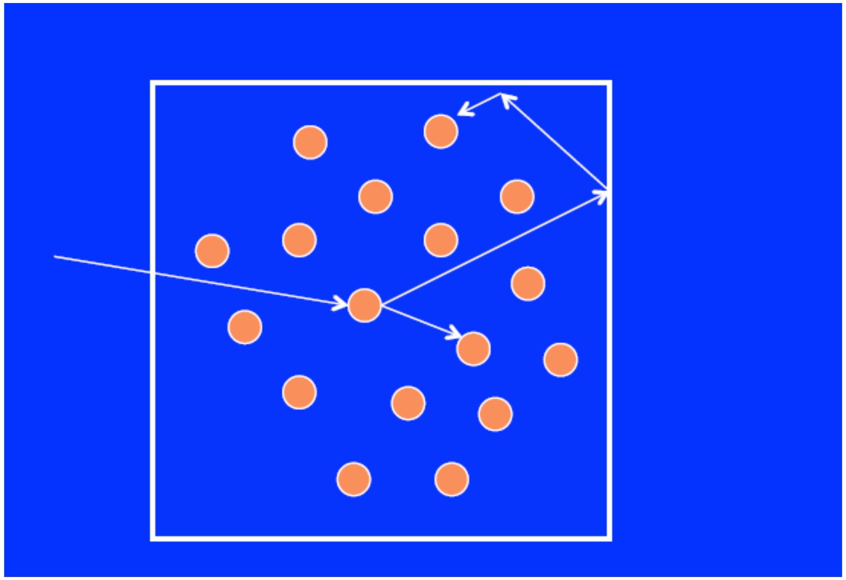
The neutrons are leaking out and stopping the chain reaction in a sub-critical mass



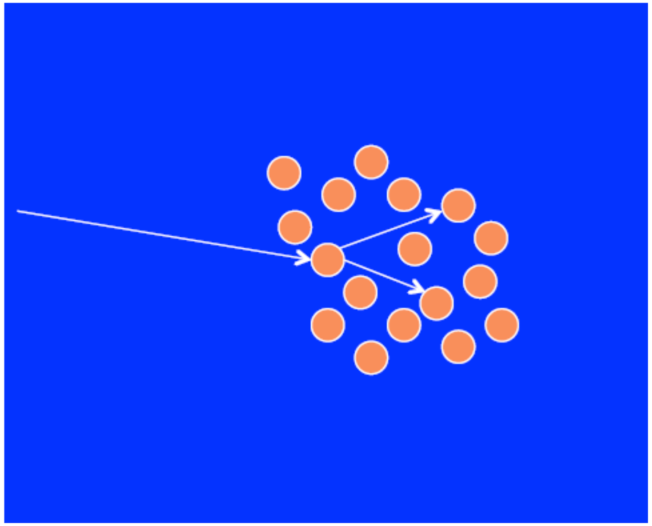
Solution 1: add more material



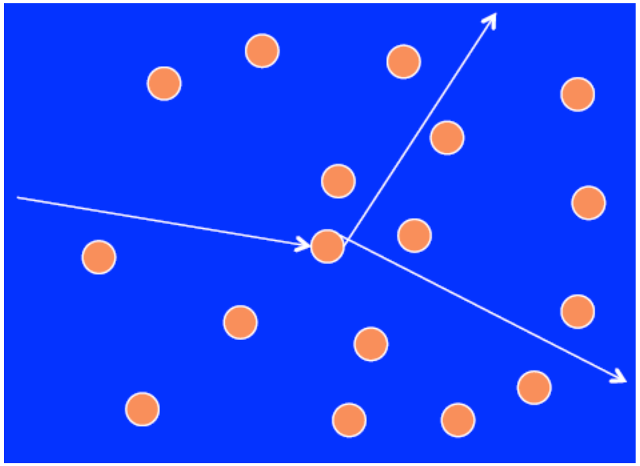
Solution2: reflect the neutron back in



Solution 3: increase the density



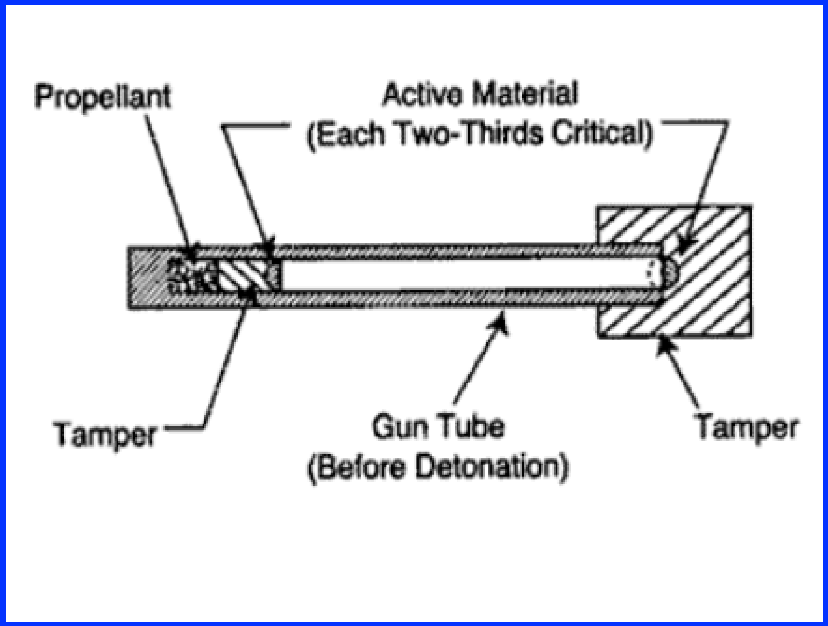
How to get the material together before it blows apart?



- **There are always neutrons around**
- **Once chain reaction starts, material will heat up, expand, stop reaction**
- **How to get enough material together fast enough?**

Gun-type bomb

- **Simple, reliable – can be built without testing**
- **Highly inefficient – require lots of nuclear material (50-60 kg of 90% enriched HEU)**
- **Can only get high yield with HEU, not plutonium**
- **Hiroshima bomb: cannon that fired HEU projectile into HEU target**



Source: NATO

Implosion design

Hiroshima Bomb – "Little Boy"

Gun Type – Easiest to design and build (Hiroshima bomb was never tested)

About 13 kiloton explosive yield

Talk given by Dr. Charles D. Ferguson, President, Federation of American Scientists, Department of Physics, Colloquium, American University, 2012

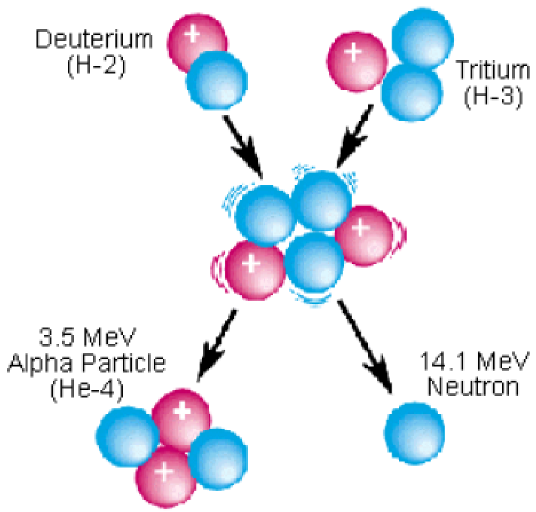
Atomic bomb is very destructive

Hiroshima: August 6, 1945

Nagasaki: August 9, 1945

Talk given by Dr. Charles D. Ferguson, President, Federation of American Scientists, Department of Physics, Colloquium, American University, 2012

The fusion process



Deuterium-Tritium Fusion Reaction

$^{2}H + ^{3}H \Rightarrow ^{4}He + n + Q \equiv 17.6$ MeV

Energy release Q=17.6 MeV

In comparison

$^{2}H + ^{2}H \Rightarrow ^{1}H + ^{3}H + Q \equiv 4.0$ MeV
$^{2}H + ^{2}H \Rightarrow ^{3}He + n + Q \equiv 3.2$ MeV
$^{3}H + ^{3}H \Rightarrow ^{4}He + 2n + Q \equiv 11.3$ MeV
$^{235}U + n \Rightarrow X_A + X_B + 3n + Q \approx 200$ MeV

Fusionable Material, deuterium ^{2}H (D) and tritium ^{3}H (t):

Deuterium: natural occurrence (heavy water) (0.015%).

Tritium: natural occurrence in atmosphere through cosmic ray bombardment; radioactive with $T_{1/2}$=12.3 y.

“Advantages” of hydrogen bomb

Fusion of ^{2}H+^{3}H: $$\frac{Q}{A} = \frac{17.6\ MeV}{(3+2)\ amu} = 3.5\ \frac{MeV}{amu}$$

Fission of ^{235}U: $$\frac{Q}{A} = \frac{200\ MeV}{236\ amu} = 0.85\ \frac{MeV}{amu}$$

Fusion is 4 times more powerful than fission and generates 24 times more neutrons!

Neutron production:

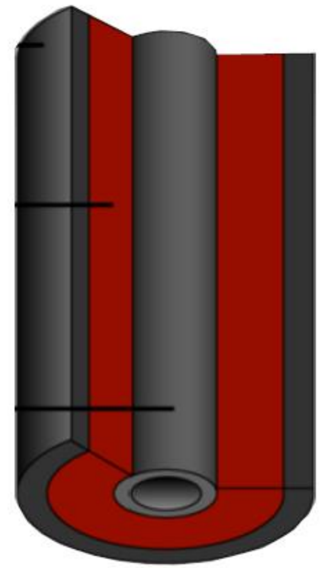
$$^2H + {}^3H: \quad \frac{n}{A} = \frac{1}{5} = 0.2$$

$$^{235}U + n: \quad \frac{n}{A} = \frac{2}{236} = 0.0085$$

https://isnap.nd.edu/Lectures/phys20061/pdf/10.pdf

Hydrogen bomb uses a fission bomb to initiate the fusion reaction

Fuel



Primary Fission Device

Core: ^{239}Pu, ^{235}U,
plus $^{2}H+^{3}H$ booster

Shell: ^{238}U tamper

High explosive lenses

Secondary Fusion Device

Radiation channel

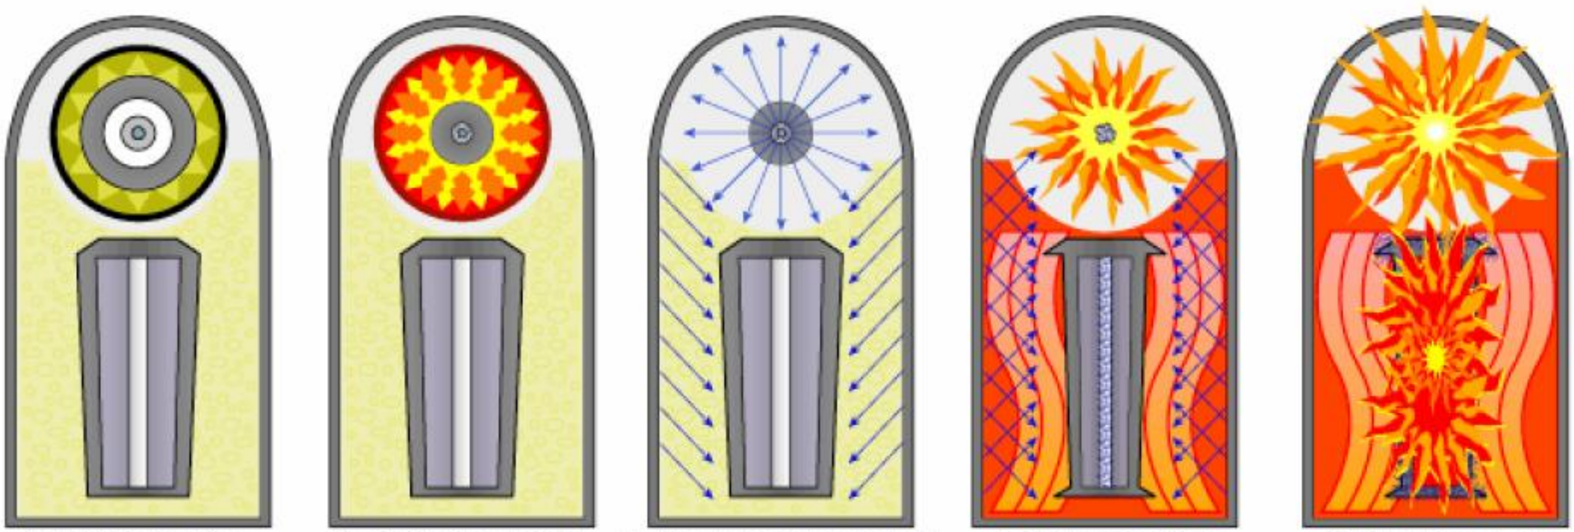
^{239}Pu sparkplug

^{6}Li, ^{2}H, ^{3}H fusion cell

^{238}U tamper

https://isnap.nd.edu/Lectures/phys20061/pdf/10.pdf

Event sequence



1. Warhead before firing; primary (fission bomb) at top, secondary (fusion fuel) at bottom, all suspended in polystyrene foam.
2. HE fires in primary, compressing plutonium core into supercriticality and beginning a fission reaction.
3. Fissioning primary emits X-rays which reflect along the inside of the casing, irradiating the polystyrene foam.
4. Polystyrene foam becomes plasma, compressing secondary, and plutonium sparkplug begins to fission.
5. Compressed and heated, lithium-6 deuteride fuel begins fusion reaction, neutron flux causes tamper to fission. A fireball is starting to form...

Additional pressure from recoil of exploding shell (ablation)!

https://isnap.nd.edu/Lectures/phys20061/pdf/10.pdf

You don’t want to build a hydrogen bomb!

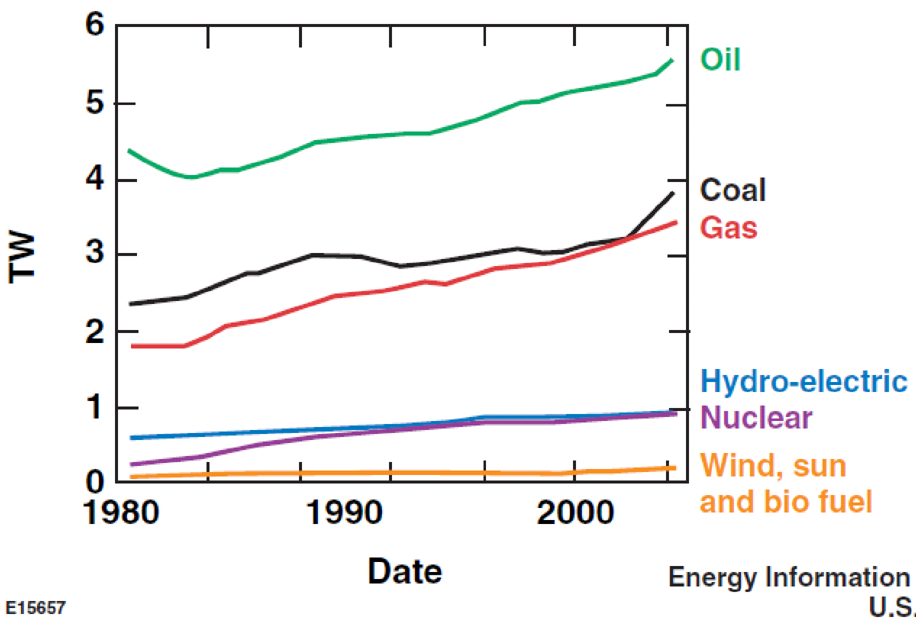
World energy consumption is dominated by the use of dwindling fossil fuels

Fossil fuel	Estimated reserve	(2005 consumption rate) Years remaining
Oil	1,277,702 million barrels	32 years
Natural gas	~6,500,000 billion cubic ft	72 years
Coal	1,081,279 million tons	252 years

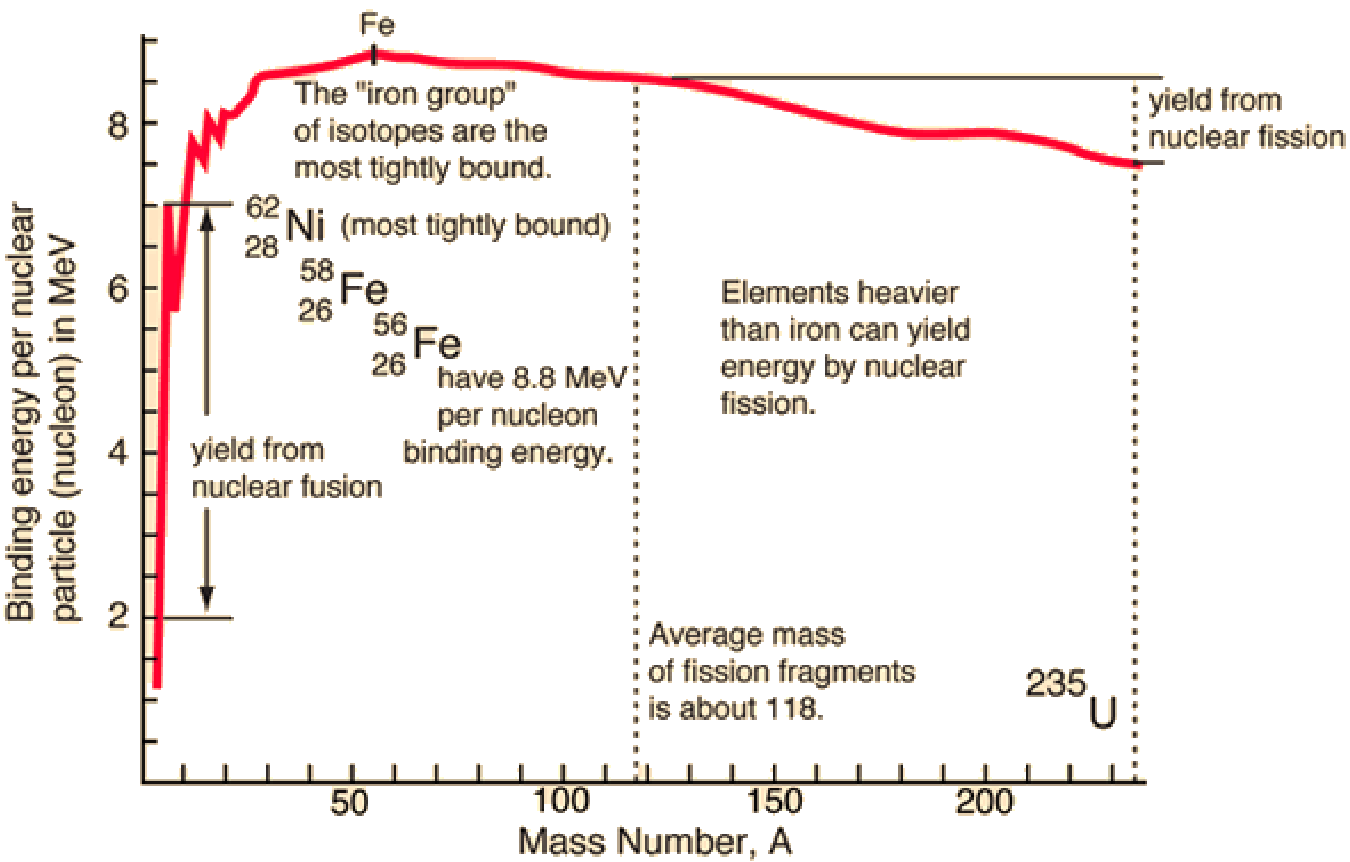


While predictions about the exact number of remaining years vary, fossil fuels will run out.

Energy Information Administration (EIA) 2006 Annual Report, U.S. Department of Energy, Washington, D.C.

*from Laboratory for Laser Energetics, University of Rochester, Rochester, NY

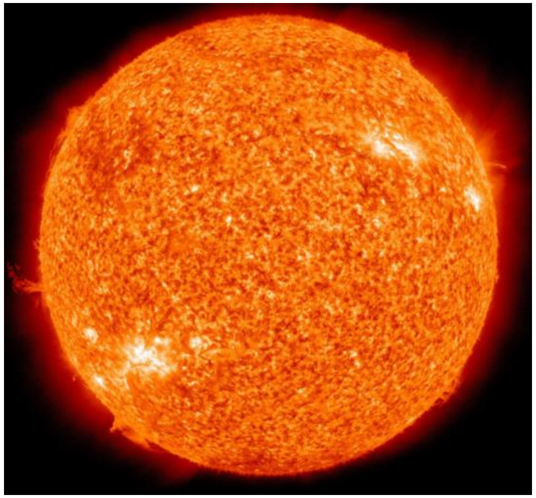
The “iron group” of isotopes are the most tightly bound

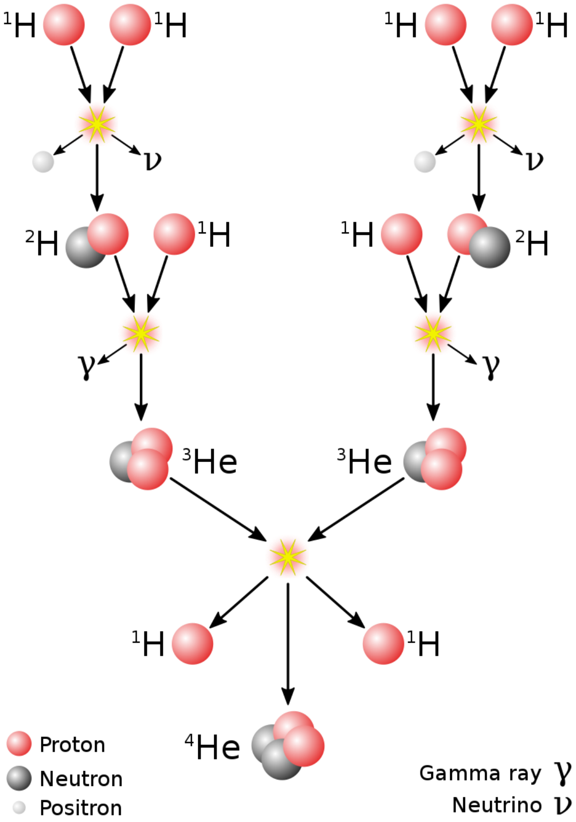


http://hyperphysics.phy-astr.gsu.edu/hbase/nucene/nucbin.html

Fusion in the sun provides the energy

- **Proton-proton chain in sun or smaller**

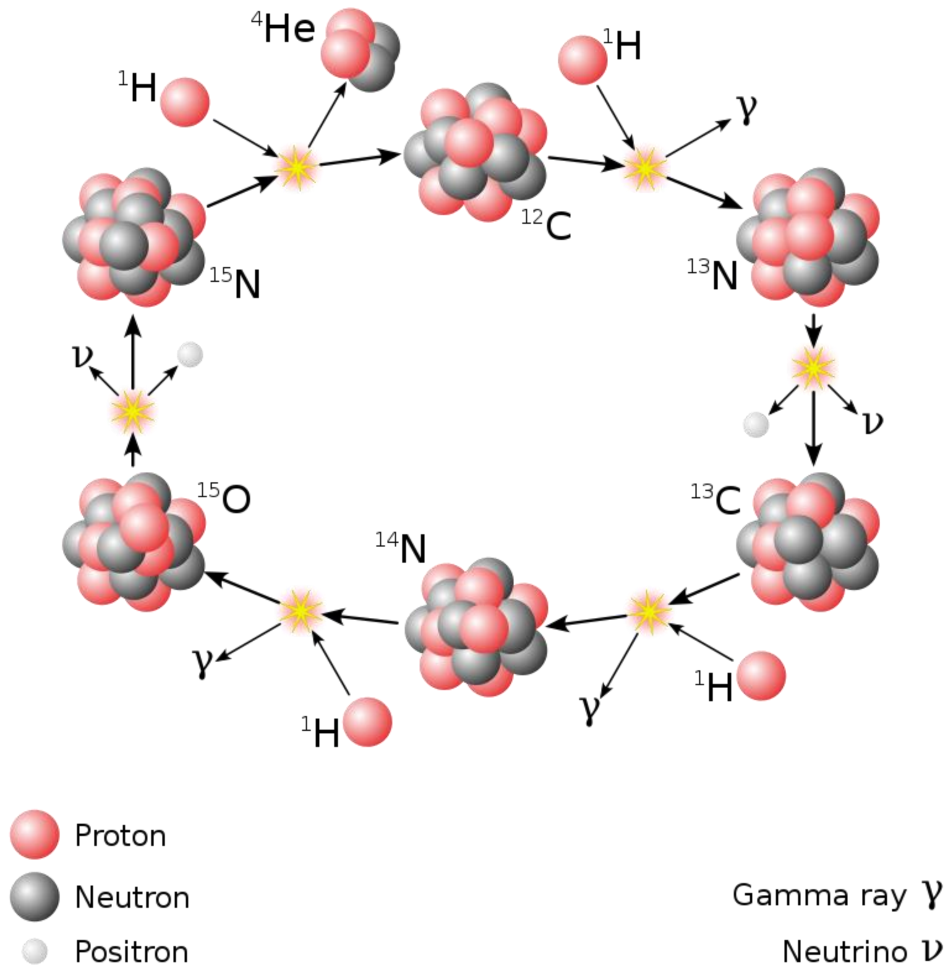




- **Particles are confined by the gravity.**

https://en.wikipedia.org/wiki/Sun
https://en.wikipedia.org/wiki/Nuclear_fusion

In heavy sun, the fusion reaction is the CNO cycle



https://en.wikipedia.org/wiki/Nuclear_fusion

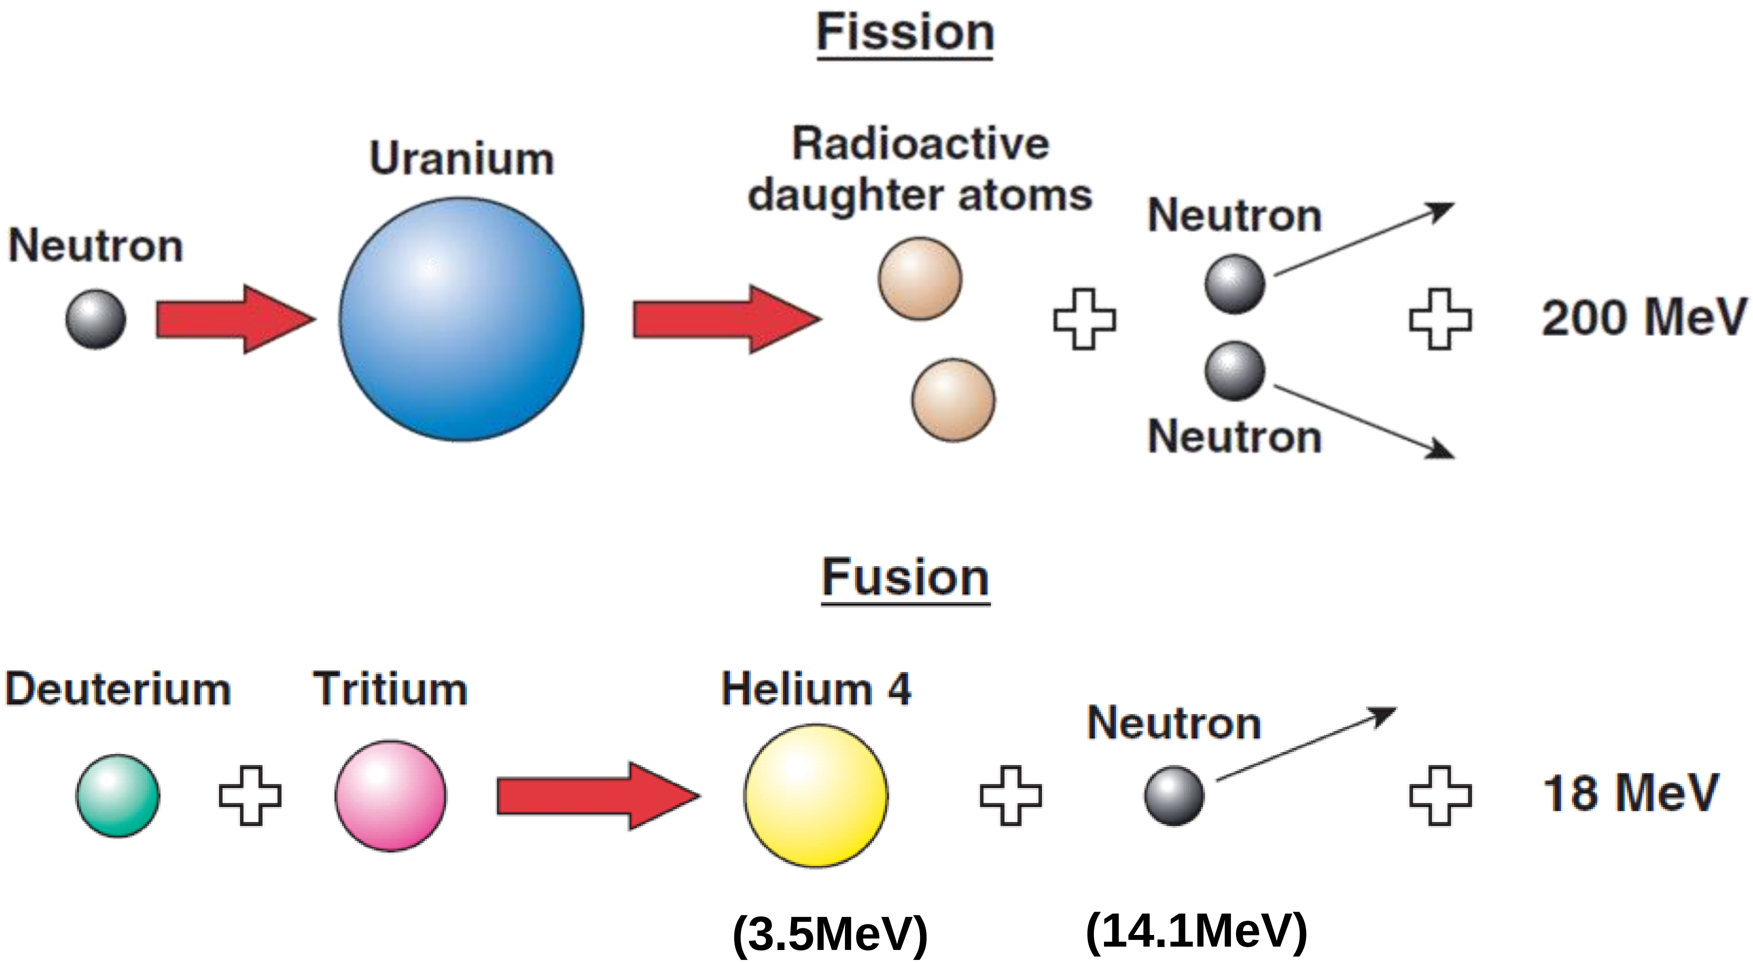
The cross section of proton-proton chain is much smaller than D T fusion

Reaction	$\sigma_{10\ keV}$ (barn)	$\sigma_{100\ keV}$ (barn)	σ_{max} (barn)	ε_{max} (keV)
$D+T \rightarrow \alpha+n$	2.72×10^{-2}	3.43	5.0	64
$D+T \rightarrow T+p$	2.81×10^{-4}	3.3×10^{-2}	0.06	1250
$D+T \rightarrow {}^3He+n$	2.78×10^{-4}	3.7×10^{-2}	0.11	1750
$T+T \rightarrow \alpha+2n$	7.90×10^{-4}	3.4×10^{-2}	0.16	1000
$D+{}^3He \rightarrow \alpha+p$	2.2×10^{-7}	0.1	0.9	250
$p+{}^6Li \rightarrow \alpha+{}^3He$	6×10^{-10}	7×10^{-3}	0.22	1500
$p+{}^{11}B \rightarrow 3\alpha$	(4.6×10^{-17})	3×10^{-4}	1.2	550
$p+p \rightarrow D+e^{+}+v$	(3.6×10^{-26})	(4.4×10^{-25})		
$p+{}^{12}C \rightarrow {}^{13}N+\gamma$	(1.9×10^{-26})	2.0×10^{-10}	1.0x10.4	400
${}^{12}C+{}^{12}C$ (all branches)		(5.0×10^{-103})		

- "( )" are theoretical values while others are measured values.

The Physics of Inertial Fusion, by Stefano Atzeni and Jürgen Meyer-Ter-Vehn

Nuclear fusion and fission release energy through energetic neutrons



Nuclear fusion provides more energy per atomic mass unit (amu) than nuclear fission

Fusion of $^{2}H+^{3}H$: $$\frac{Q}{A}=\frac{17.6\ MeV}{(3+2)\ amu}=3.5\ \frac{MeV}{amu}$$

Fission of ^{235}U: $$\frac{Q}{A}=\frac{200\ MeV}{236\ amu}=0.85\ \frac{MeV}{amu}$$

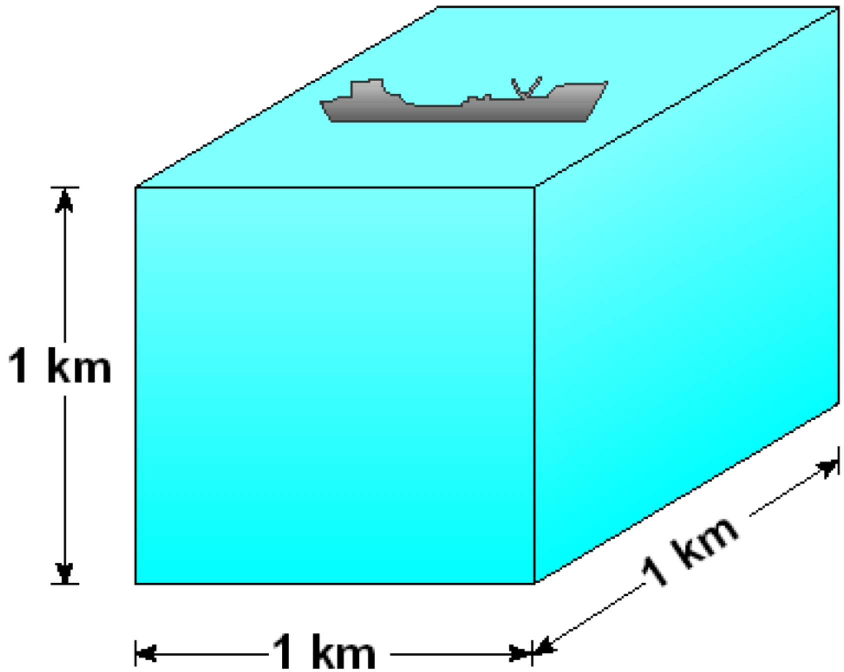
	Half-life (years)
U235	**7.04×10^{8}**
U238	**4.47×10^{9}**
…	
Tritium	**12.3**

What could you do with 1 kg DT?

- 1 kg DT -> 340 Tera joules
  - You can drive your car for ~40,000 km (back and forth between Keelung and Kaoshiung for 50 times).
  - You can keep your furnace running for 8 years.
  - You can blow things up! 1 TJ = 250 tons of TNT.

*R. Betti, HEDSA HEDP Summer School, 2015

Enormous fusion fuel can be produced from sea water

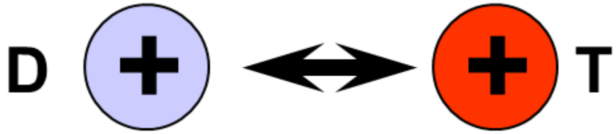


= Total energy of world oil reserve

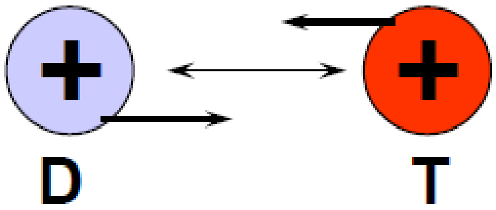
*R. Betti, HEDSA HEDP Summer School, 2015

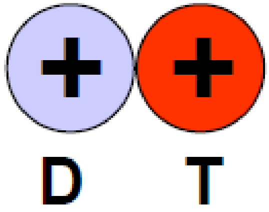
A “hot plasma” at 100M ⁰C is needed

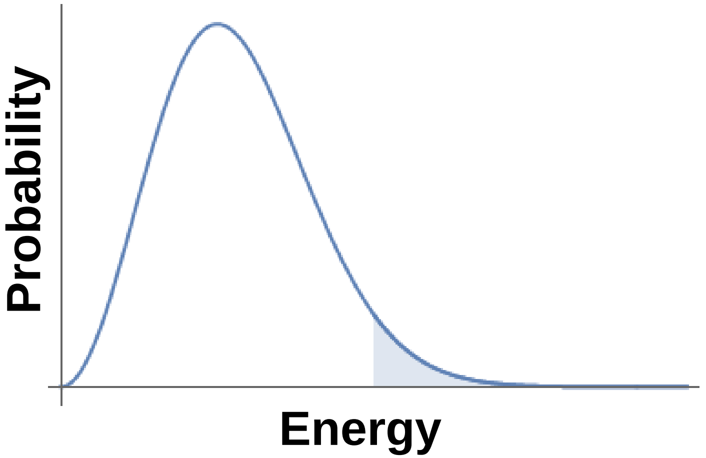
- Probability for fusion reactions to occur is low at low temperatures due to the coulomb repulsion force.



- If the ions are sufficiently hot, i.e., large random velocity, they can collide by overcoming coulomb repulsion



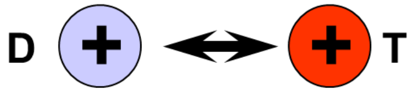


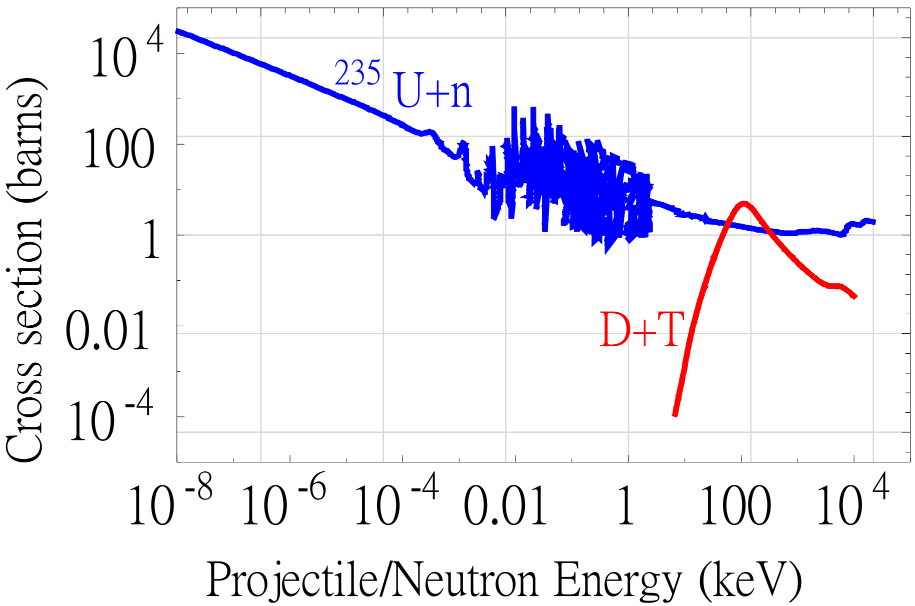


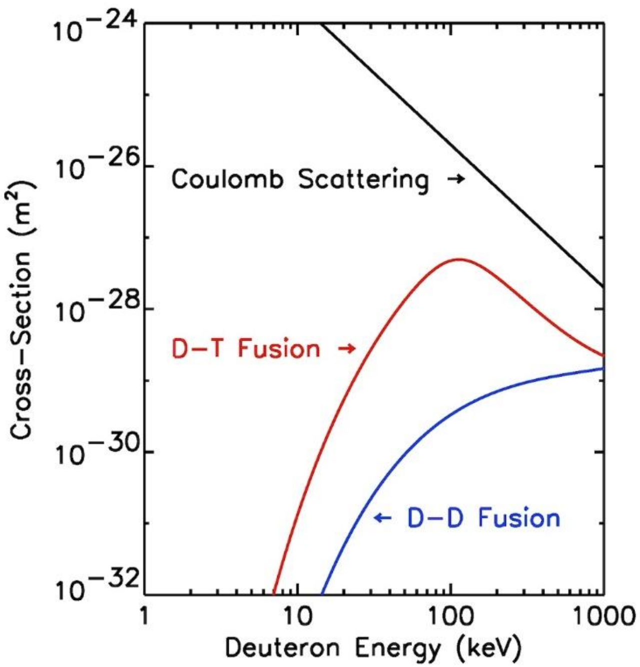
*R. Betti, HEDSA HEDP Summer School, 2015

Fusion is much harder than fission, a "hot plasma" at 100M ⁰C is needed

- **Fission:** $n + ^{235}_{92}U \rightarrow ^{236}_{92}U \rightarrow ^{144}_{56}Ba + ^{89}_{36}Kr + 3n + 177\ \mathrm{MeV}$
- **Fusion:** $D + T \rightarrow He^4\,(3.5\ \mathrm{MeV}) + n\,(14.1\ \mathrm{MeV})$

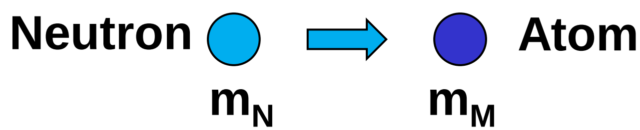






https://www6.lehigh.edu/~eus204/lab/PCL_fusion.php#x1-10096

Fast neutrons are slowed down due to the collisions

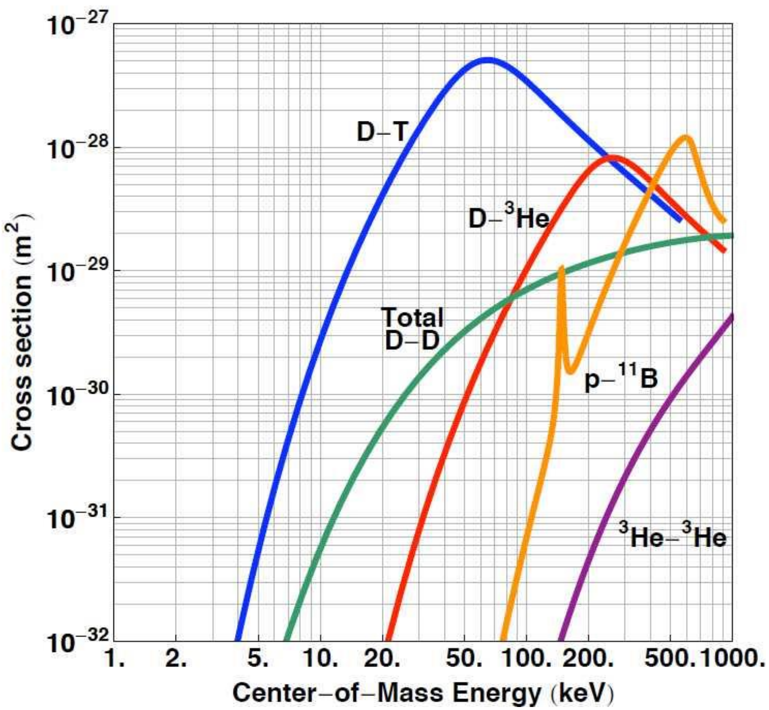


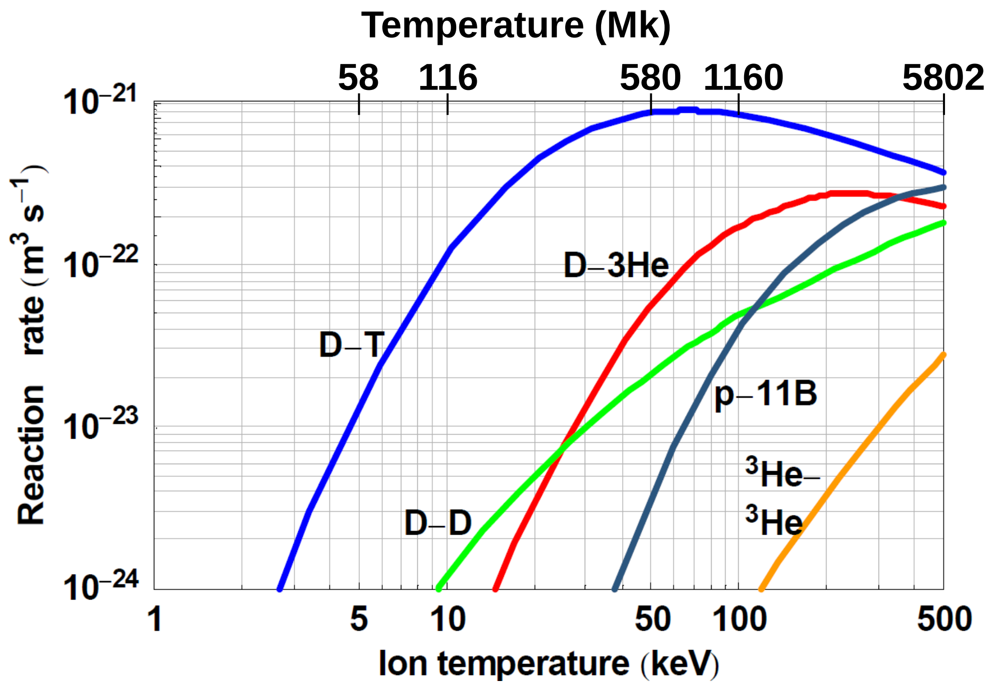
- **A moderator is used to slow down fast neutrons but not to absorb neutrons.**
- **For m_M~m_N, the energy decrement is higher. Therefore, H slows down neutron most efficiently.**
- **However, H + n → D, i.e., H absorbs neutrons.**
- **The best option is the D in the heavy water (D_2O).**

	Energy decrement	Neutron scattering cross section (σs) (Barns)	Neutron absorption cross section (σs) (Barns)
H	1	49 (H_2O)	0.66 (H_2O)
D	0.7261	10.6 (D_2O)	0.0013 (D_2O)
C	0.1589	4.7 (Graphite)	0.0035 (Graphite)

https://en.wikipedia.org/wiki/Neutron_moderator#cite_note-Weston-4
https://energyeducation.ca/encyclopedia/Neutron_moderator#cite_note-3

Fusion doesn’t come easy





$D + D \rightarrow T + p$

$\rightarrow He^3 + n$

$D + T \rightarrow He^4 + n$

$D + He^3 \rightarrow He^4 + p$

$p + B^{11} \rightarrow 3He^4$

- **Reaction rate:**

$$< \sigma v >= \int \sigma(v) v f(v)\, dv$$

Cross section

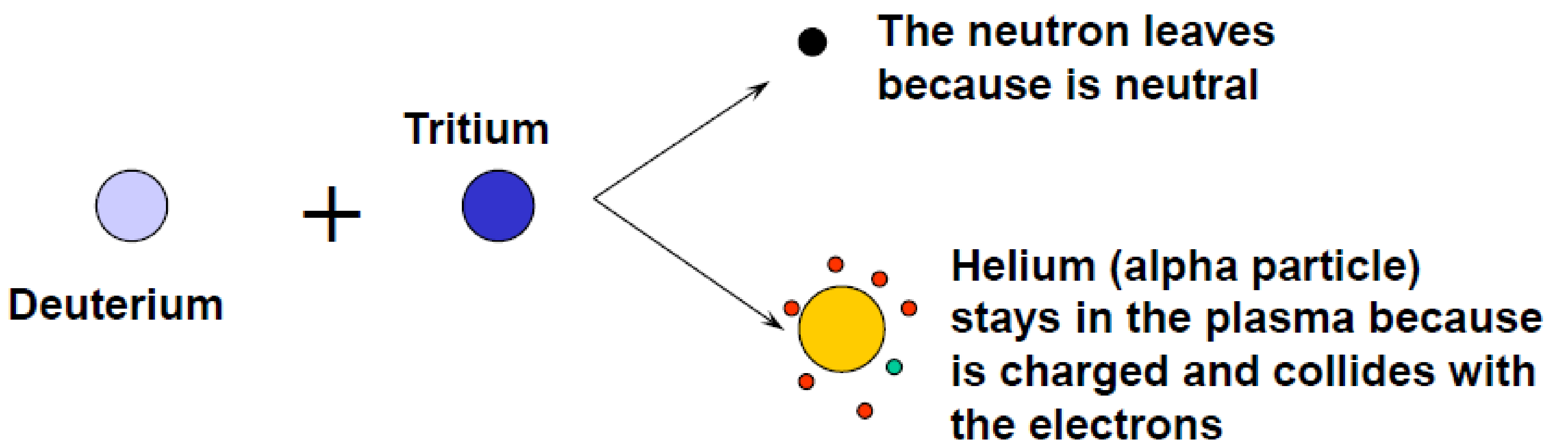
Santarius, J. F., “Fusion Space Propulsion – A Shorter Time Frame Than You Think”, JANNAF, Monterey, 5-8 December 2005.

It takes a lot of energy or power to keep the plasma at 100M ^{0}C

- Let the plasma do it itself!



- The α-particles heat the plasma.

*R. Betti, HEDSA HEDP Summer School, 2015

Under what conditions the plasma keeps itself hot?

- **Steady state 0-D power balance:**

  $S_\alpha + S_h = S_B + S_k$

  S_α: α particle heating

  S_h: external heating

  S_B: Bremsstrahlung radiation

  S_k: heat conduction lost

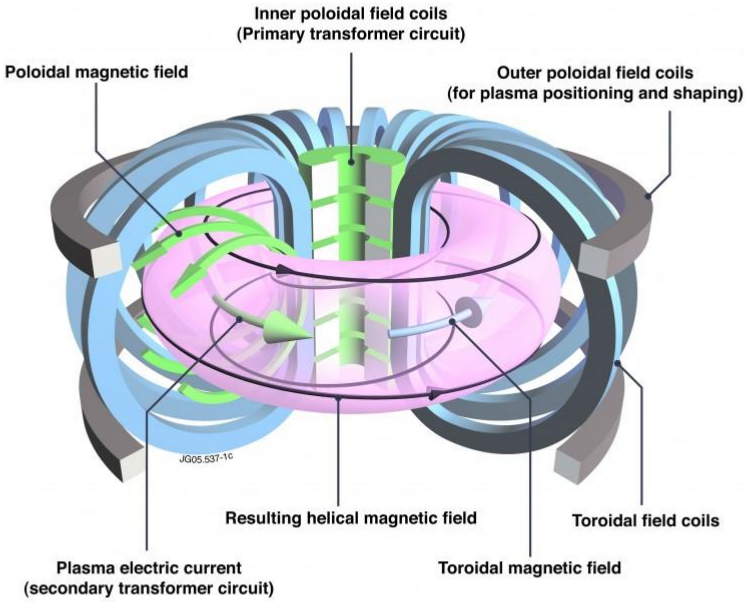
Ignition condition: Pτ > 10 atm-s = 10 Gbar - ns

- **P: pressure, or called energy density**
- **τ is confinement time**

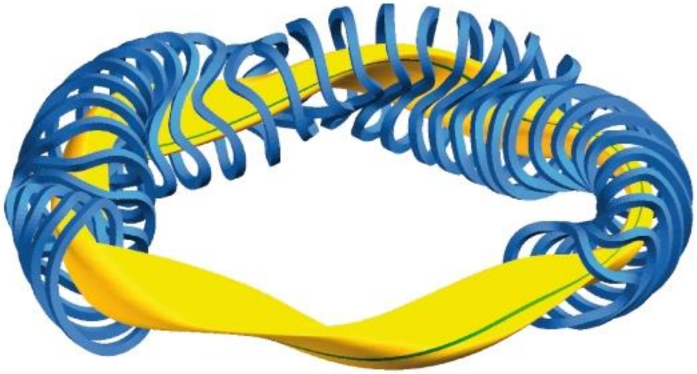
The plasma is too hot to be contained

- **Solution 1: Magnetic confinement fusion (MCF), use a magnetic field to contain it. P~atm, τ~sec, T~10 keV (10^8 ºC)**

Tokamak



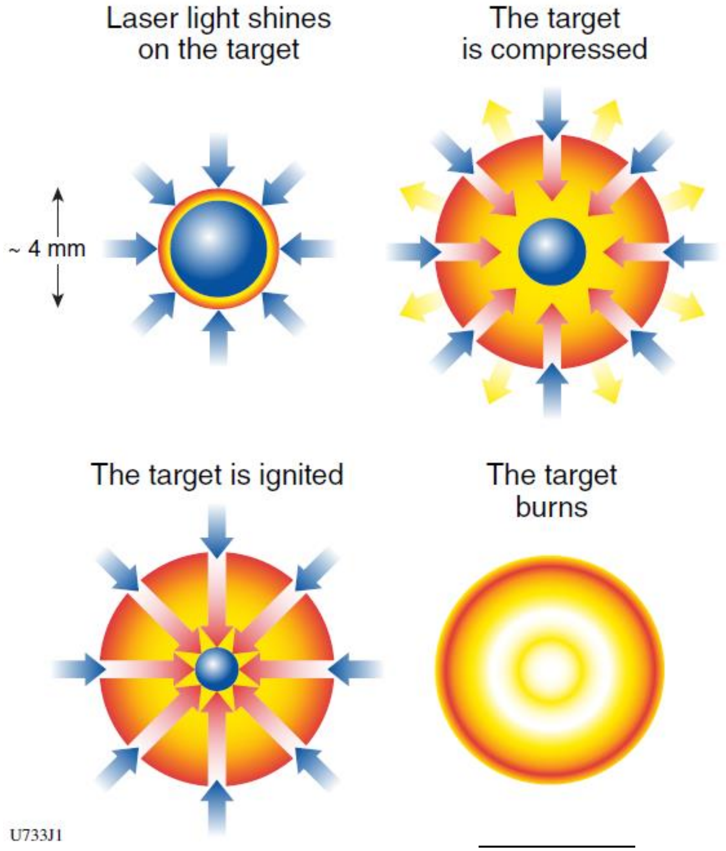
Stellarator



https://www.euro-fusion.org/2011/09/tokamak-principle-2/
https://en.wikipedia.org/wiki/Stellarator

Don’t confine it!

- **Solution 2: Inertial confinement fusion (ICF). Or you can say it is confined by its own inertia: P~Gigabar, τ~nsec, T~10 keV (10^8 ⁰C)**



Inertial confinement fusion: an introduction, Laboratory for Laser Energetics, University of Rochester

To control? Or not to control?

- **Magnetic confinement fusion (MCF)**

  - **Plasma is confined by toroidal magnetic field.**

- **Inertial confinement fusion (ICF)**

  - **A DT ice capsule filled with DT gas is imploded by laser.**

Laboratory for Laser Energetics, University of Rochester is a pioneer in laser fusion

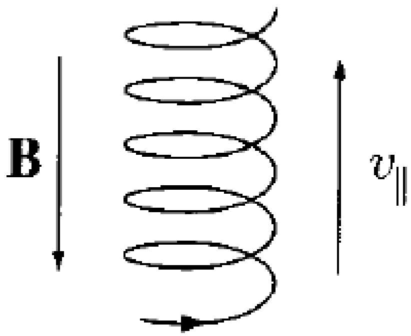
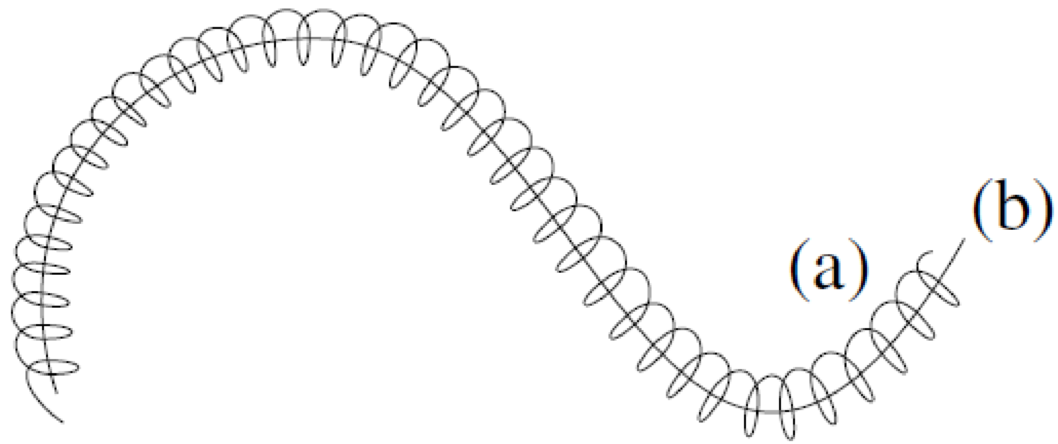
Charged particles gyro around the magnetic fields

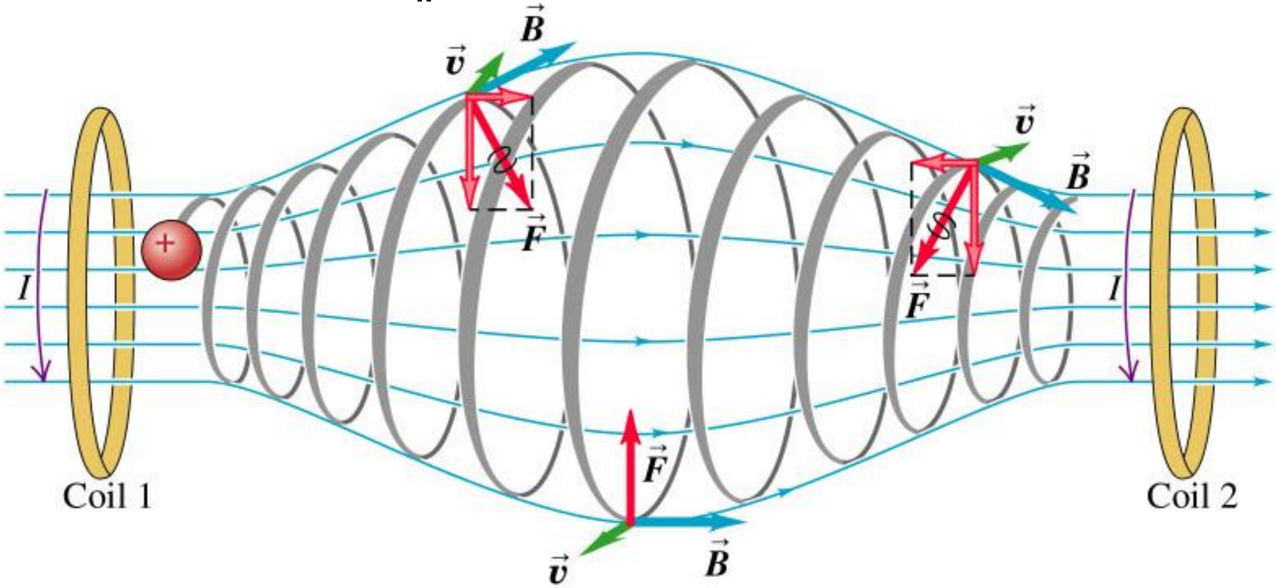


$$r_L = \frac{mv_{\perp}}{|q|B}$$



Charged particles can be partially confined by a magnetic mirror machine

- **Charged particles with small $v_{||}$ eventually stop and are reflected while those with large $v_{||}$ escape.**



$$\frac{1}{2}mv^2 = \frac{1}{2}m{v_{||}}^2 + \frac{1}{2}m{v_{\perp}}^2$$

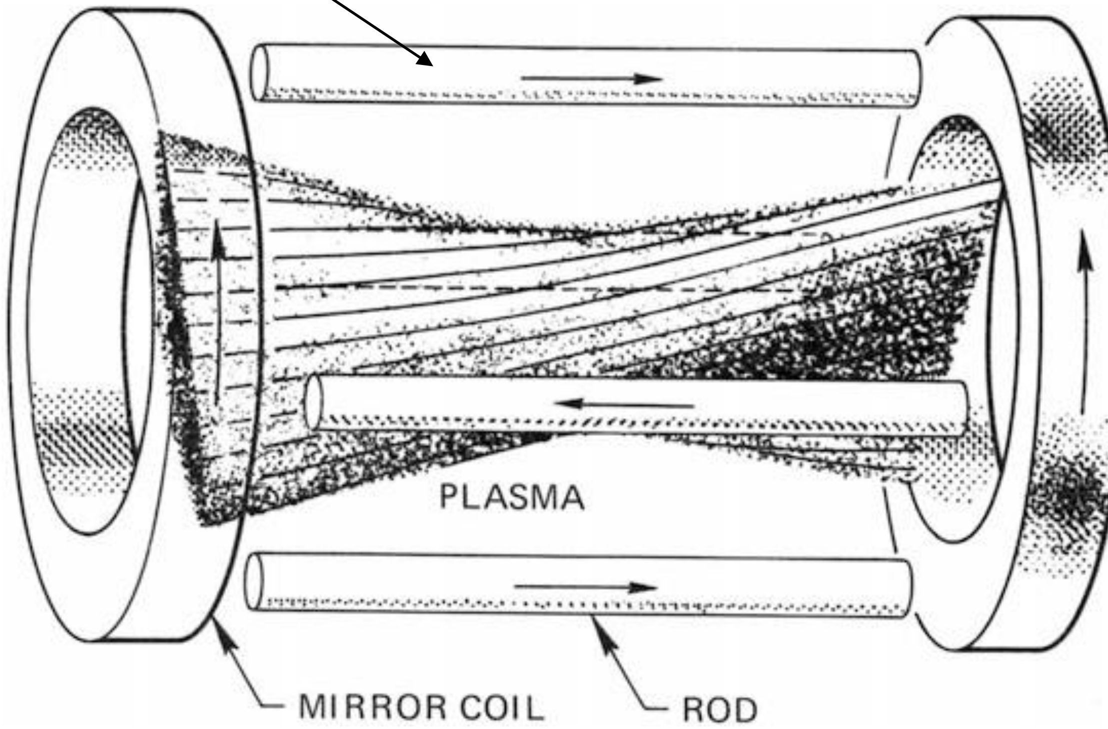
- **Large $v_{||}$ may occur from collisions between particles.**

- **Those confined charged particle are eventually lost due to collisions.**

https://i.stack.imgur.com/GlzGZ.jpg

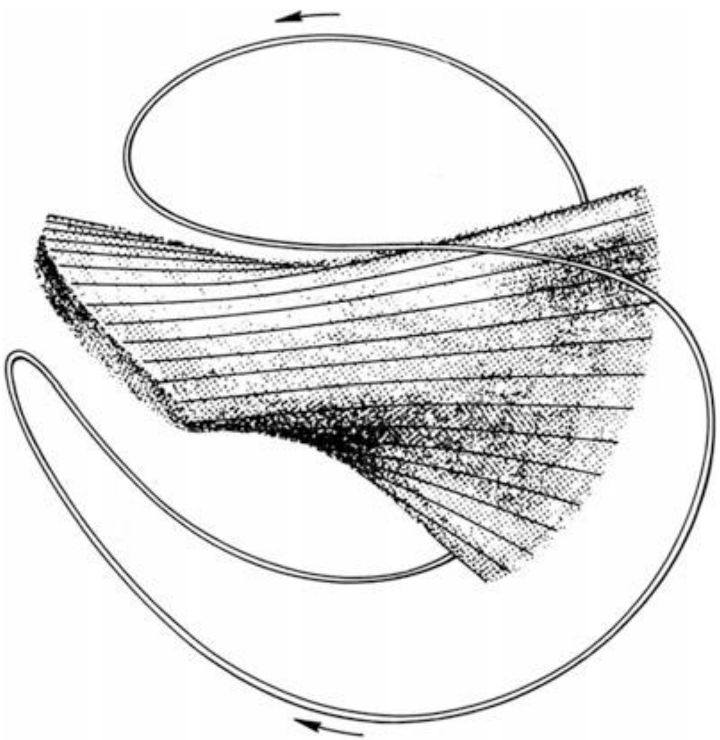
"Ioffe bars" are added to stabilize the Rayleigh-Taylor instabilities at the center of the mirror machine

Ioffe bars



A "baseball coil" is obtained if one links the coils and the bars into a single conductor

- **Baseball coil**



- **MFTF-B mirror machine**

Plasma can be confined in a doughnut-shaped chamber with toroidal magnetic field

- **Tokamak - "toroidal chamber with magnetic coils" (тороидальная камера с магнитными катушками)**

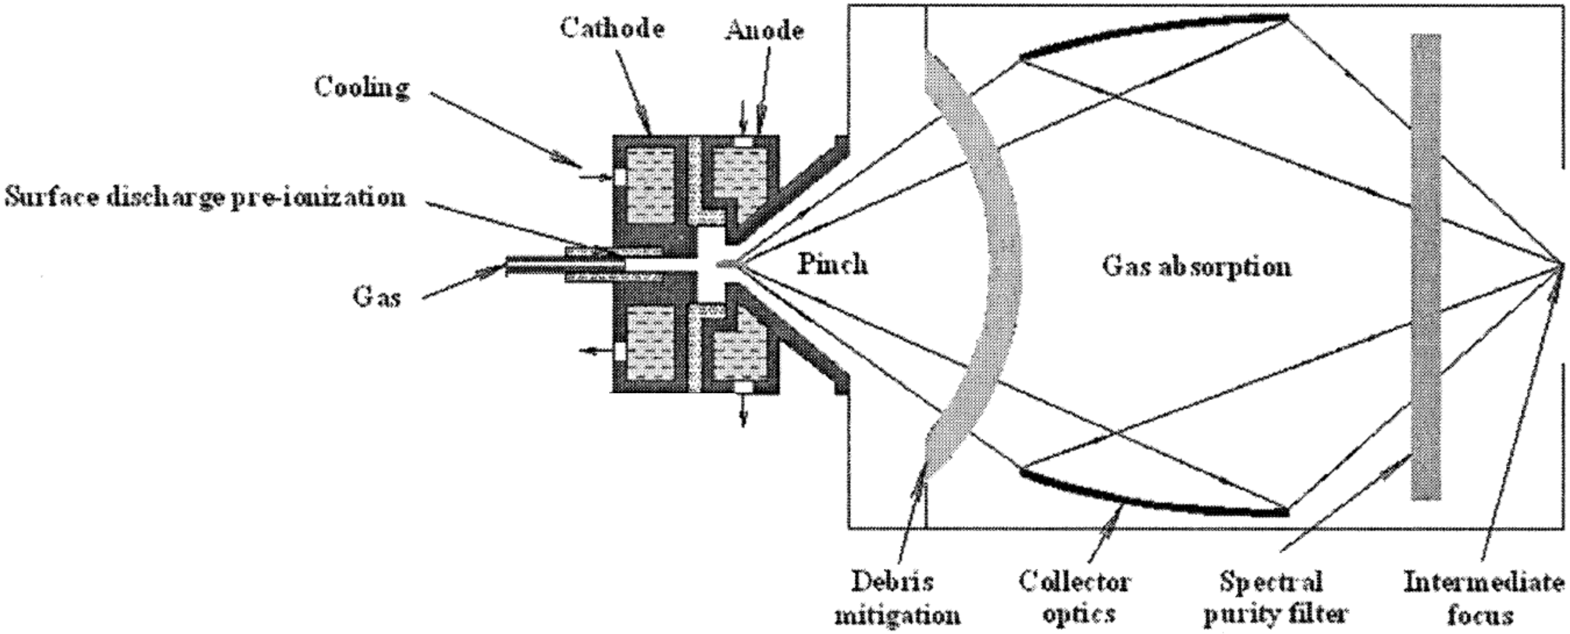
V. Bakshi, EUV sources for lithography
R. S. Abhari, etc., J. Micro/Nanolithography, MEMS, and MOEMS, 11, 021114 (2012)

Discharge produced plasma (DPP) can generate EUV light for EUV lithography

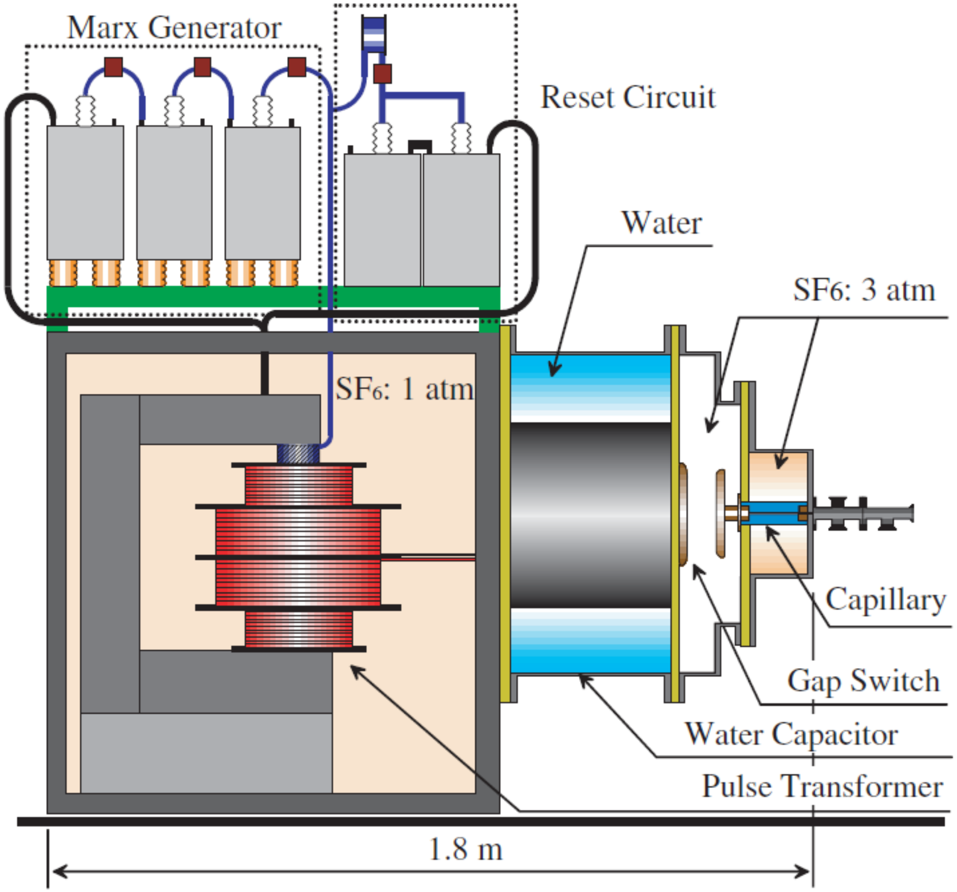


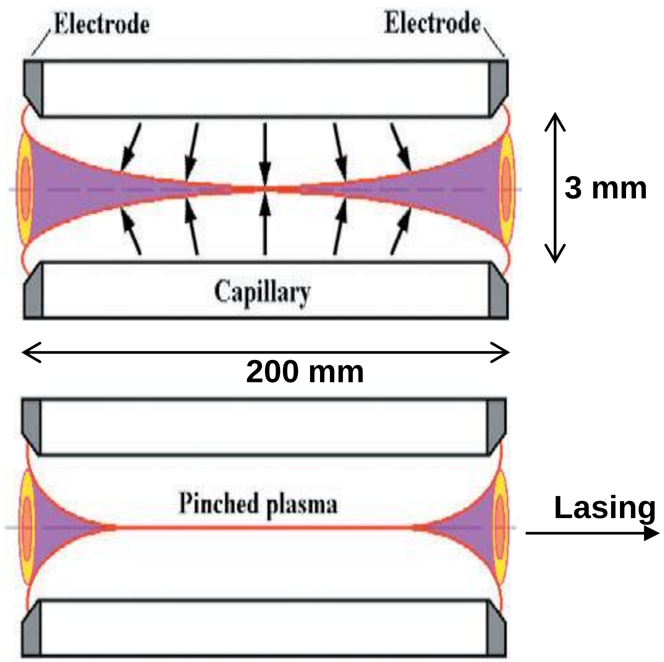
- **Electrodes are damaged significantly due to the heat and sputtering by ions.**

	Laser-produced plasma (LPP)	Discharge-produced plasma (DPP)
Pros	Commercial system available.	High conversion efficiency.
Cons	Low conversion efficiency.	Short system life time due to electrode erosion.

V. Borisov, etc., Proc. SPIE 6611, Laser Optics 2006: High-Power Gas Lasers, 66110B (12 April 2007)

Soft x-ray laser can be generated using a capillary z-pinch discharge



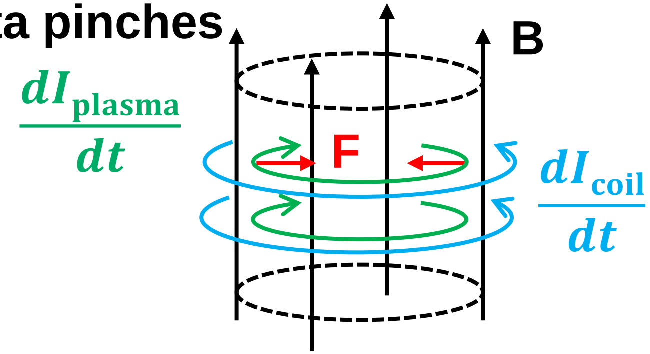


- **If 200～500 mTorr Ar is used as the filled gas, 46.9 nm (26.5 eV) Ne-like Ar laser can be built.**

Y. Hayashi, etc., Plasma Sources Sci. Technol. 13, 675 (2004)

EUV light can be generated using gas-puff theta pinches

- Theta pinches



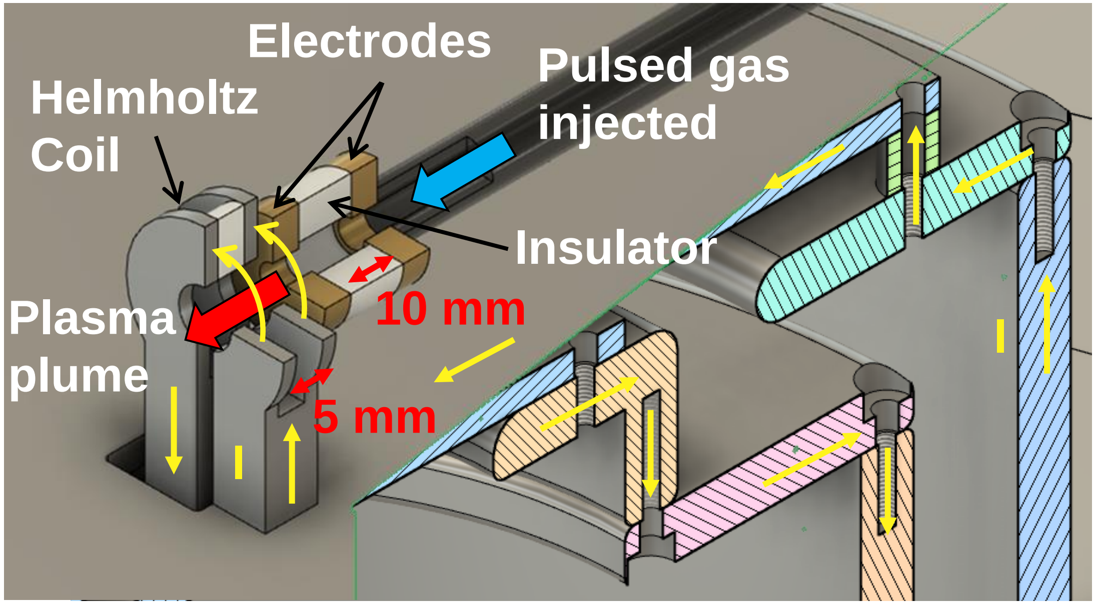
- Adiabatic compression:

$$TV^{\gamma-1} = \text{const} \qquad T_{\text{f}} = T_{\text{o}}\left(\frac{r_{\text{o}}}{r_{\text{f}}}\right)^{4/3}$$

$$T_{\text{o}} = 1 \sim 10\ \text{eV} \qquad T_{\text{f}} = 40\ \text{eV}$$

Compression ratio: $\frac{r_{\text{o}}}{r_{\text{f}}} = 16 \sim 3$

- Gas-puff Theta pinches
- High voltage is applied between electrodes to generate initial plasma via arc discharge.



- Advantages:
  - Energy is directed used for generating and heating plasma.
  - Electrodes are away from hot plasma.
  - Less current is used to generate plasma.

Simulations show that plasma with temperature higher than 30 eV can be generated on our system

- **Snow plow model is used*:**

$$\frac{d}{dt}\left(M_s\frac{da}{dt}\right) = -2\pi a\left(\frac{B^2}{8\pi} - P_0\left(\frac{a_0}{a}\right)^{2\gamma}\right)$$

$$M_s(t) = \pi m_i N_0\left(a_0{}^2 - a^2\right)\eta(t)$$

- **The magnetic field provided by a Helmholtz coil with both radius and separation equal to 5 mm:**

$$B = B_{\max}\sin(\omega t) \text{ where } B_{\max} = 9\ \mathrm{T}$$

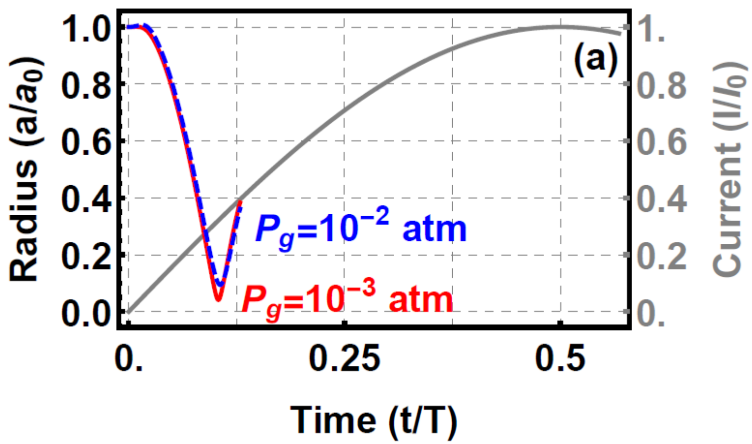
- **Initial conditions:**

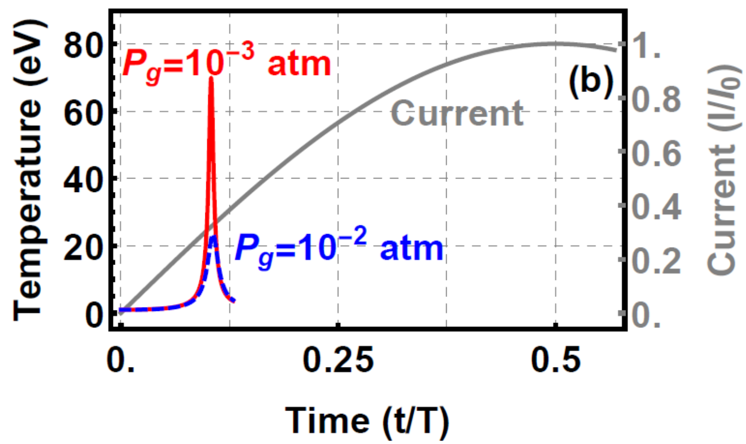
$$a_0 = 5\mathrm{mm}$$

$$P_0 = 2P_g\frac{11604}{300}$$

$$N_0 = 2.43 \times 10^{19} P_g \mathrm{cm}^{-3}$$

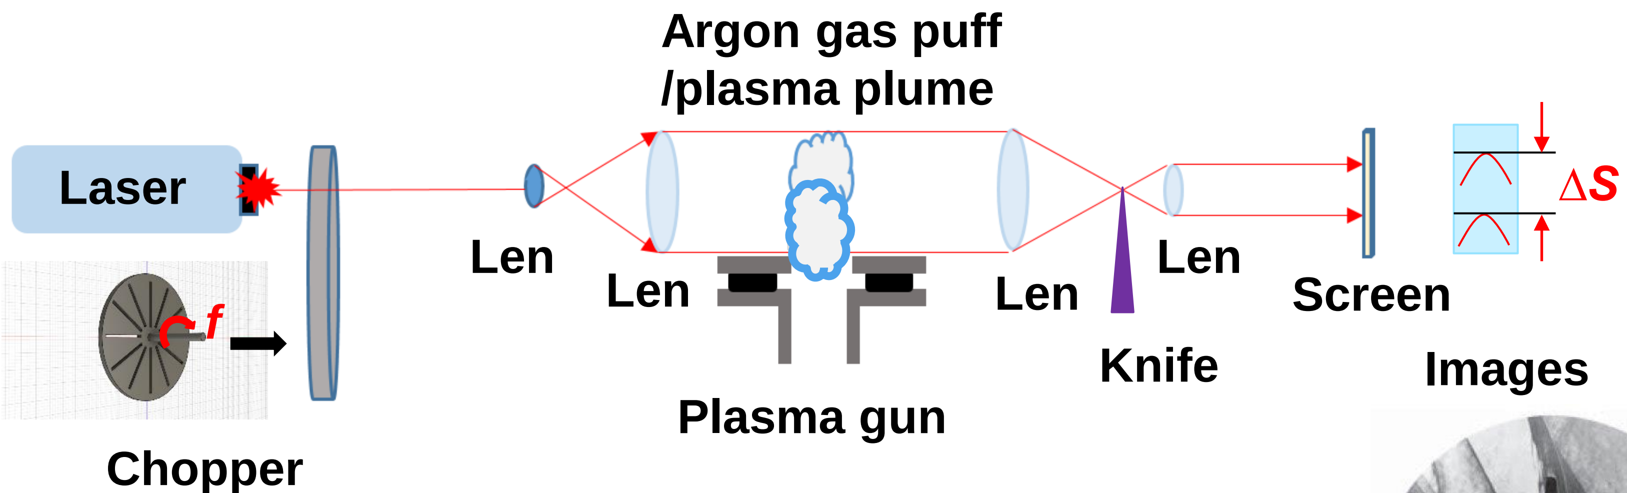
$$m_{i,Ar} = 6.67 \times 10^{-23} g$$

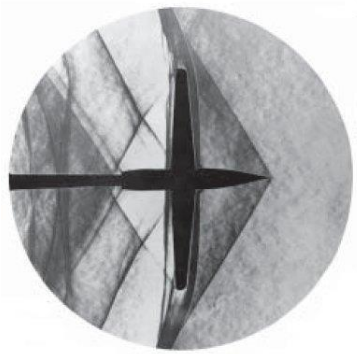




*T. Uchida, etc., Nuclear Fusion, **2**, 70, 1962

Flow speed of the Argon gas puff/plasma plume will be measured using time-resolved Schlieren system

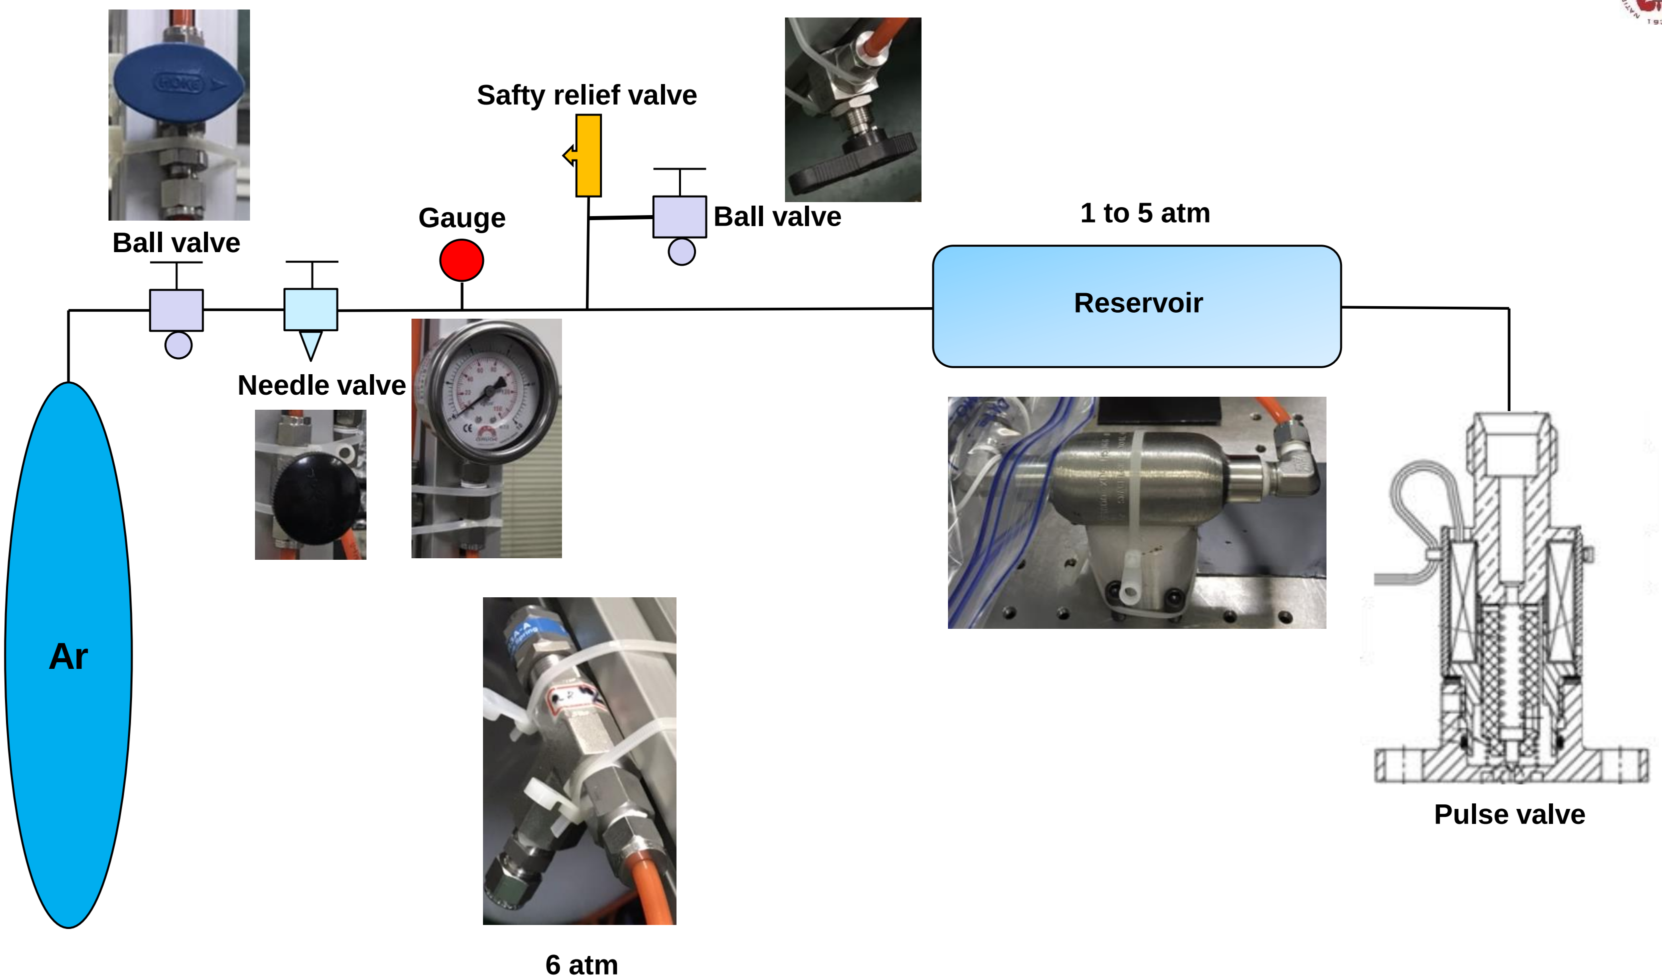




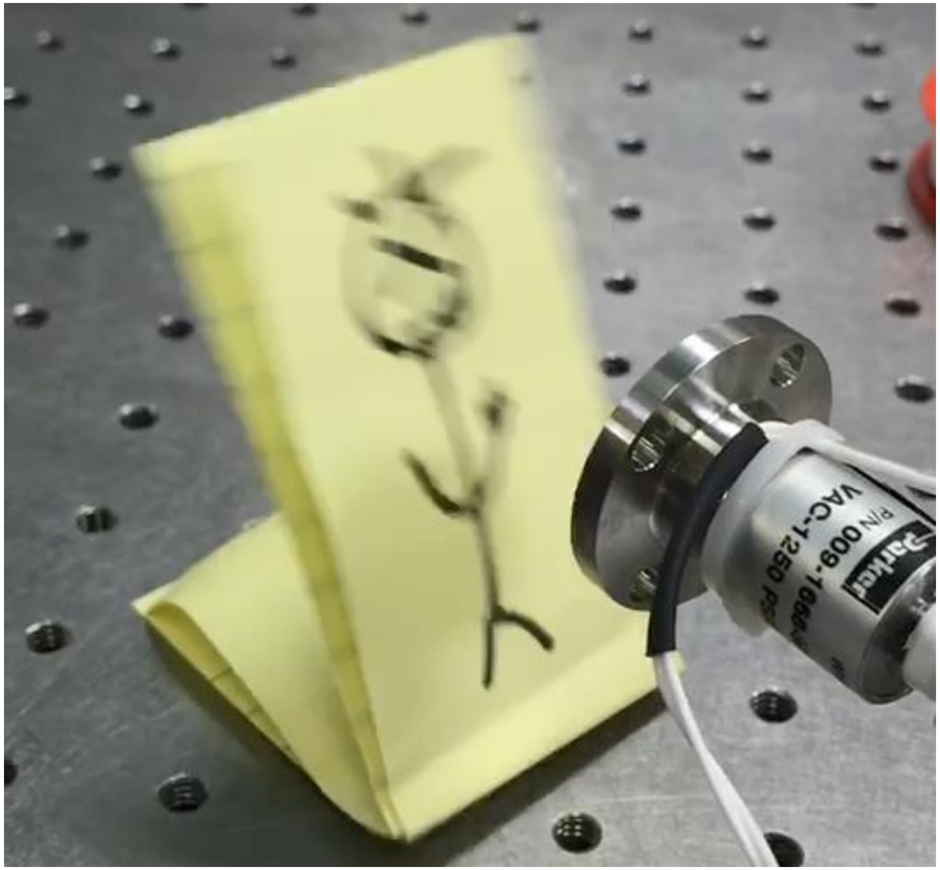
- The flow speed is important for synchronization.
- Speed: $$v = \frac{\Delta S}{\Delta t} = \Delta S f$$
- Sound speed: 300 m/sec
  For 50 μs, the traveling distance of the plume is 1.5 cm.
- An 20-kHz optical chopper provides 50 μs time separate.

https://en.wikipedia.org/wiki/Schlieren_photography

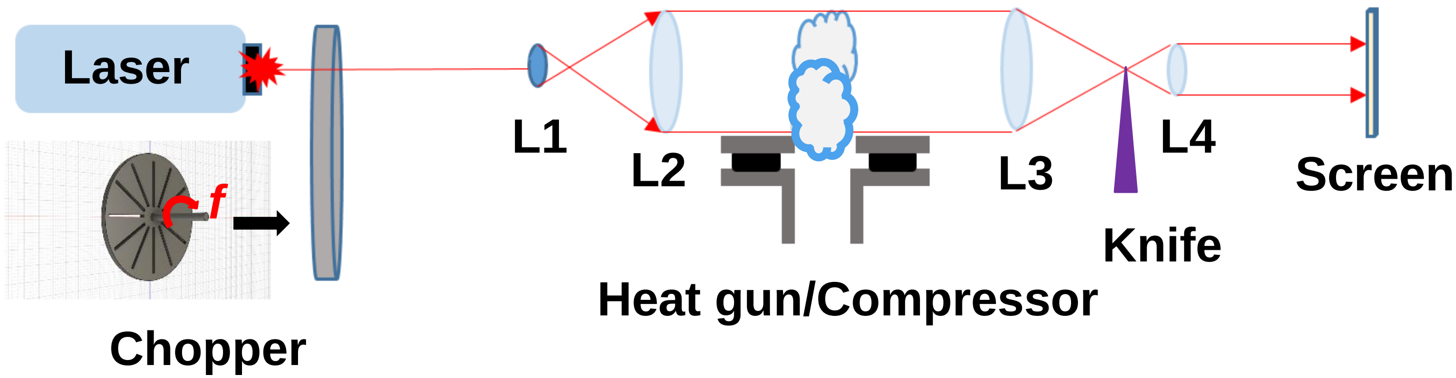
The gas-puff system in atmosphere has been built for testing

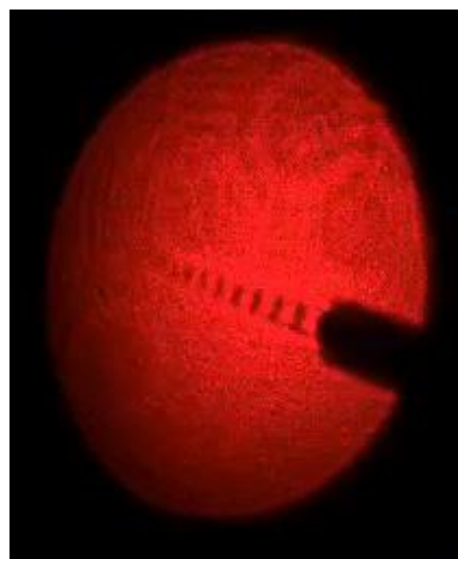


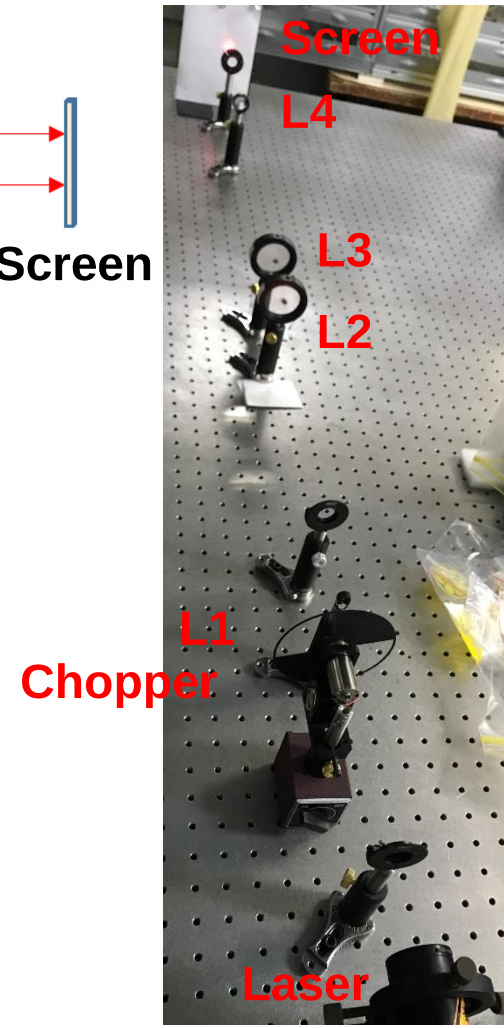
The gas-puff was capable to push two slides of papers



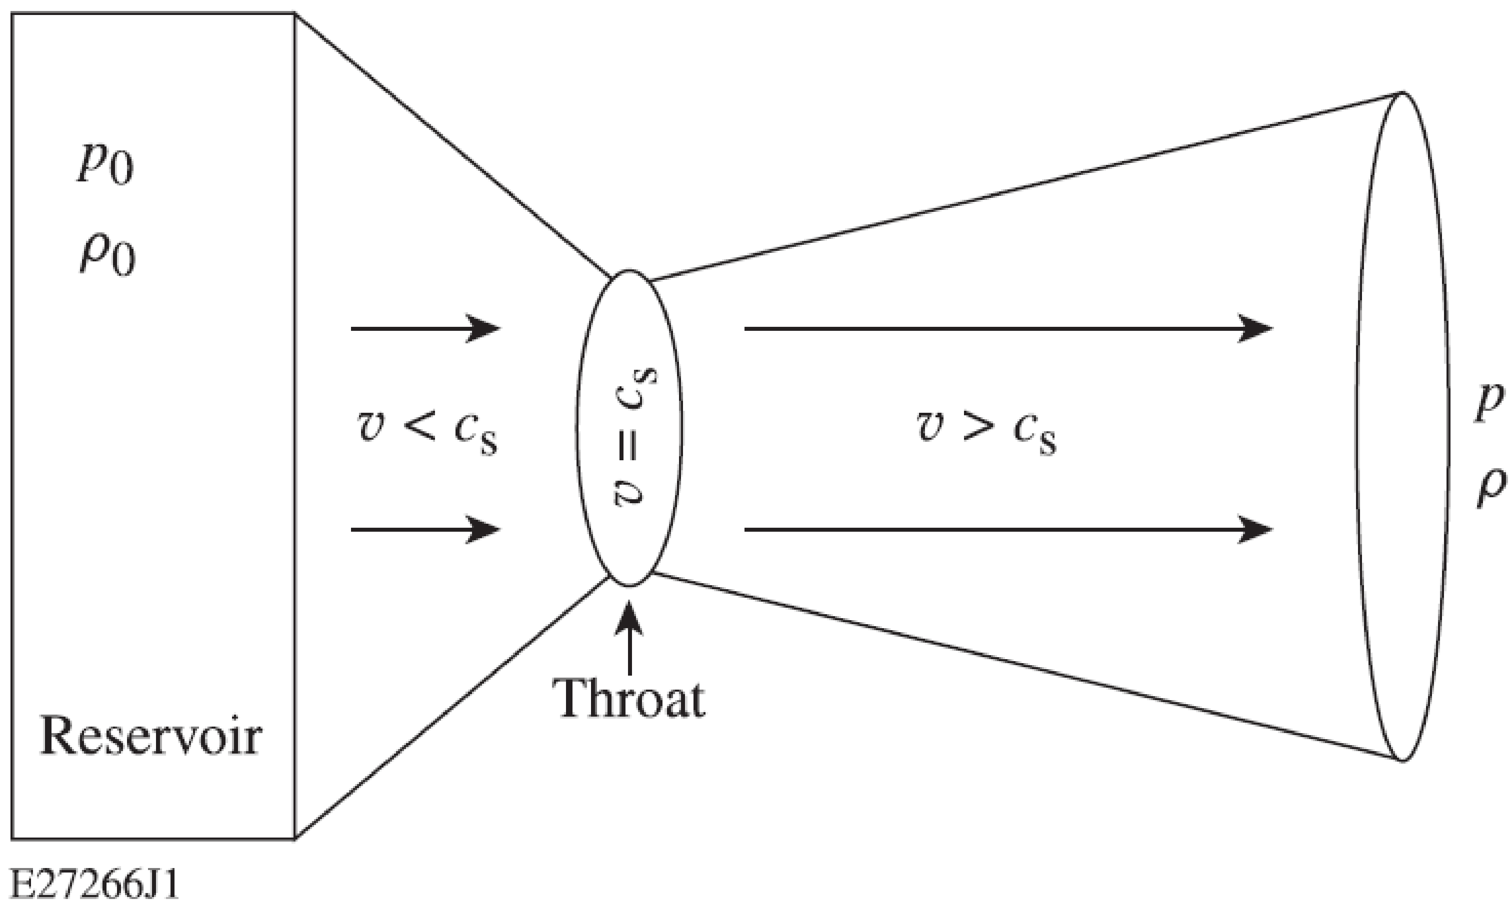
The Schlieren system has been built





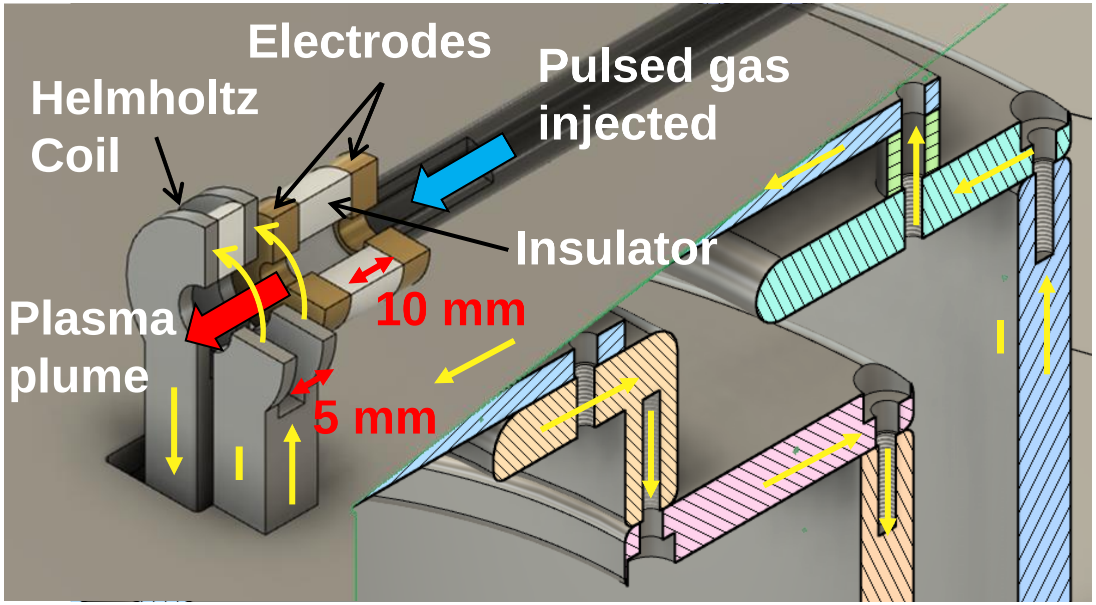


A converging/diverging nozzle is needed to generate a supersonic gas puff



*A. M. Hansen, etc., Rev. Sci. Instrum., **89**, 10C103, 2018

EUV light characteristics will be measured



- Plasma density, temperature before and after compression will be measured.
- EUV light characteristic will be measured.
  - Intensity
  - Pulse width
  - Spectrum
  - Uniformity
  - …….

Hydrodynamic equations can be written in a dimensionless form

- Dimensional form:

$$\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho\, \vec{u}) = 0$$

$$\rho\left(\frac{\partial\, \vec{u}}{\partial t} + \vec{u} \cdot \nabla\, \vec{u}\right) = -\nabla p$$

$$\frac{\partial p}{\partial t} + \vec{u} \cdot \nabla p = -\gamma p \nabla \cdot \vec{u}$$

- Dimensionless form:

$$\frac{\partial \tilde{\rho}}{\partial \tilde{t}} + \nabla \cdot \left(\tilde{\rho}\, \tilde{\vec{u}}\right) = 0$$

$$\tilde{\rho}\left(\frac{\partial\, \tilde{\vec{u}}}{\partial \tilde{t}} + \tilde{\vec{u}} \cdot \nabla\, \tilde{\vec{u}}\right) = -\nabla \tilde{p}$$

$$\frac{\partial \tilde{p}}{\partial \tilde{t}} + \tilde{\vec{u}} \cdot \nabla \tilde{p} = -\gamma \tilde{p} \nabla \cdot \tilde{\vec{u}}$$

$$\tilde{\vec{r}} = \frac{\vec{r}}{L^*}$$

$$\tilde{t} = \frac{t}{L^*}\sqrt{\frac{p^*}{\rho^*}}$$

$$\tilde{\rho} = \frac{\rho}{\rho^*}$$

$$\tilde{p} = \frac{p}{p^*}$$

$$\tilde{\vec{u}} = \vec{u}\sqrt{\frac{p^*}{\rho^*}}$$

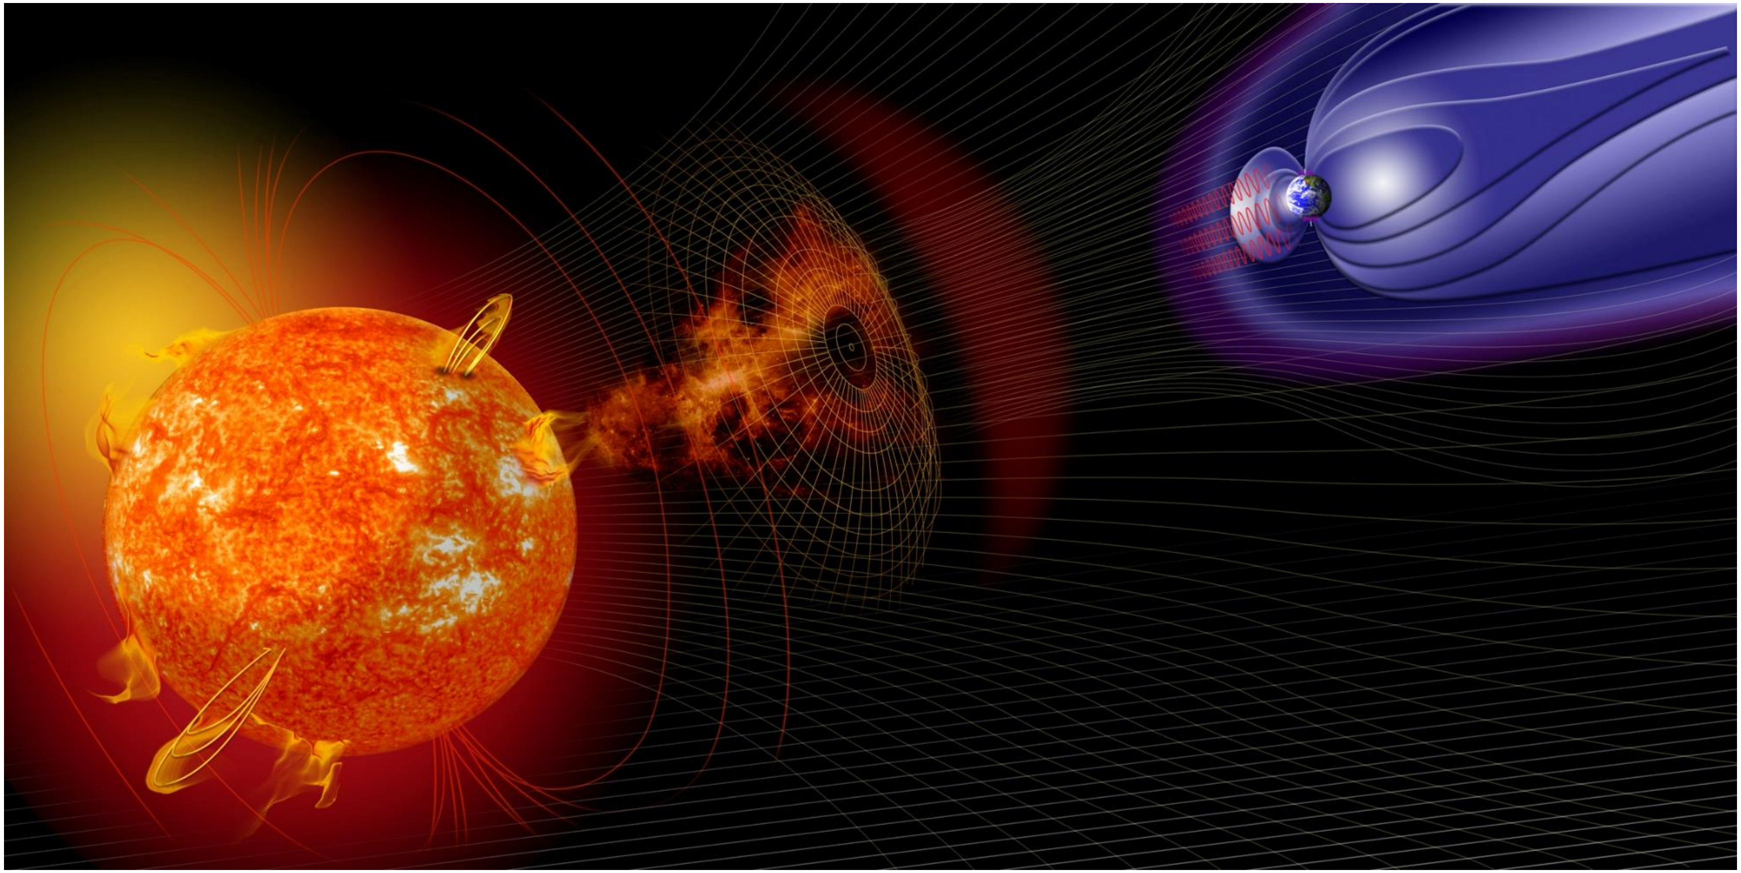
$$\tilde{\rho}_0(\tilde{r}) = f(\tilde{r})$$

$$\tilde{p}_0(\tilde{r}) = g(\tilde{r})$$

$$\tilde{\vec{u}}_0\left(\tilde{r}\right) = \sqrt{\frac{p^*}{\rho^*}}\,\vec{h}\left(\tilde{r}\right)$$

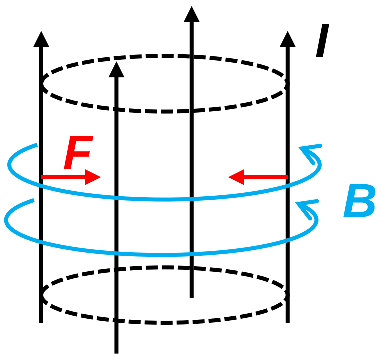
Any two hydrodynamic systems involve identically in a scaled sense if f, g, h, and $u^*(\rho^*/p^*)^{1/2}$ are the same.

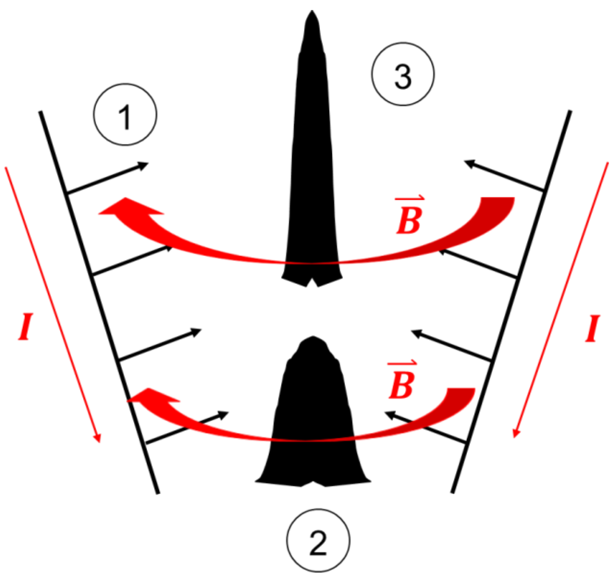
Solar wind is a supersonic plasma plume coming from the sun



https://www.nasa.gov/mission_pages/sunearth/spaceweather/index.html

A plasma jet can be generated by a conical-wire array due to the nonuniform z-pinch effect





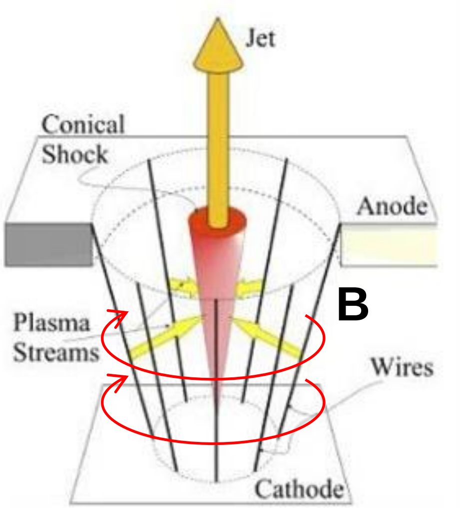
1. Wire ablation : corona plasma is generated by wire ablations.

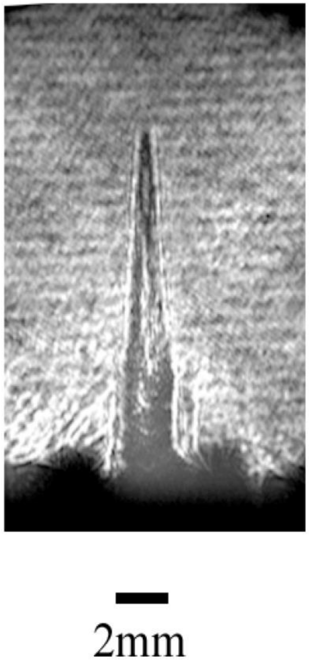
2. Precursor : corona plasma is pushed by the $\vec{J} \times \vec{B}$ force and accumulated on the axis forming a precursor.

3. Plasma jet is formed by the nonuniform z-pinch effect due to the radius difference between the top and the bottom of the array.

D. J. Ampleforda, et al., PHYSICS OF PLASMAS 14, 102704 (2007)

Plasma jets generated by conical-wire arrays can be used to simulate the solar wind





Driver:

I_{peak}=1 MA
T_{rise}=240 ns

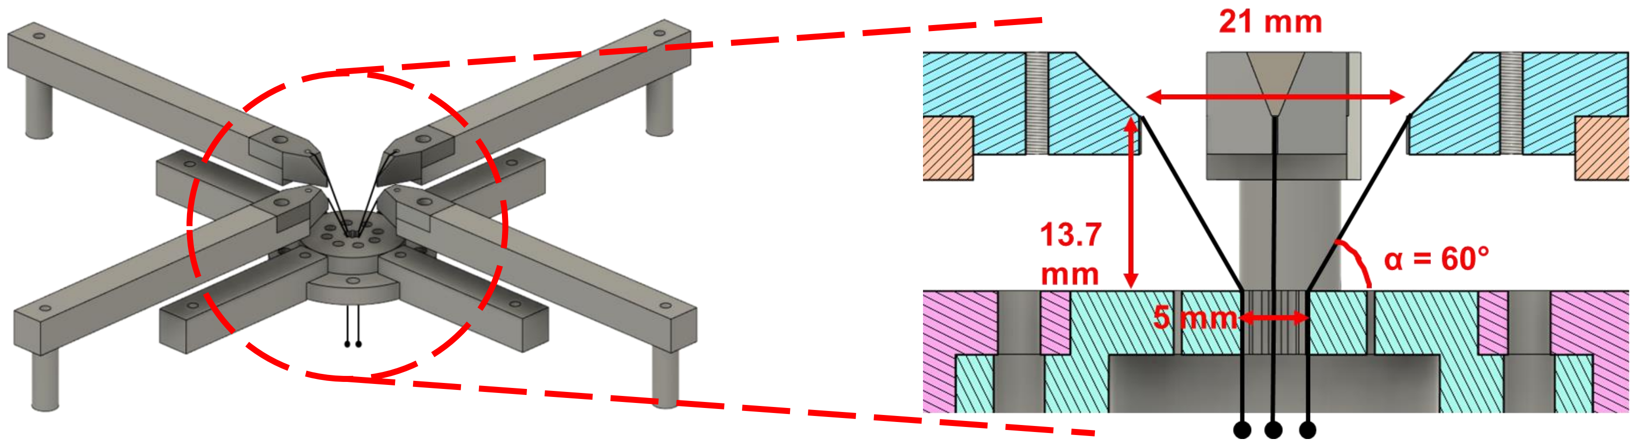
Jet conditions:

V ~ 200 km/s
n_e ~10^{19} cm^{-3}

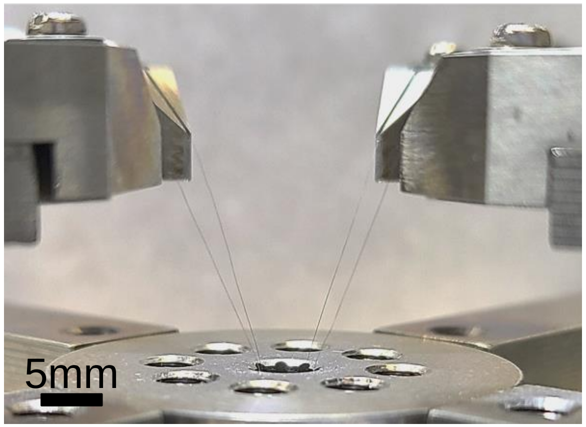
- **A conical-wire array can be used to generate a plasma jet where the flow speed is ~ 200 km/s with Mach number up to 20.**
- **The solar wind is a supersonic plasma flow with Mach number ~ 5-10 and the flow speed ~ 400 km/s.**

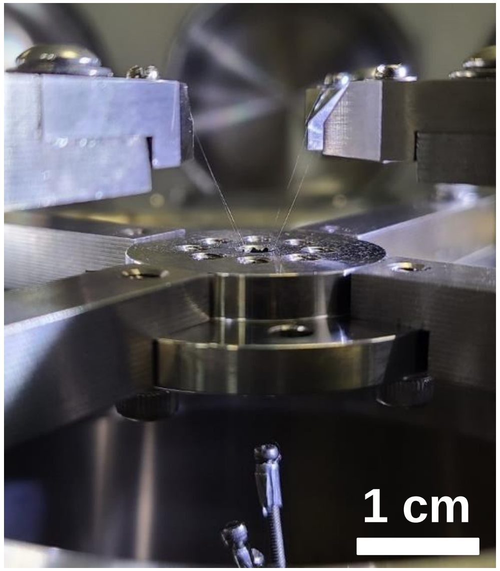
* S. V. Lebedev *et al.* Astrophys. J. 564, 113 (2002)
* George K. Parks, Physics of Space Plasmas: An Introduction (Perseus Books (Sd), 1991).

Our conical-wire array consists of 4 tungsten wires with an inclination angle of 30° with respect to the axis



- Conical-wire array

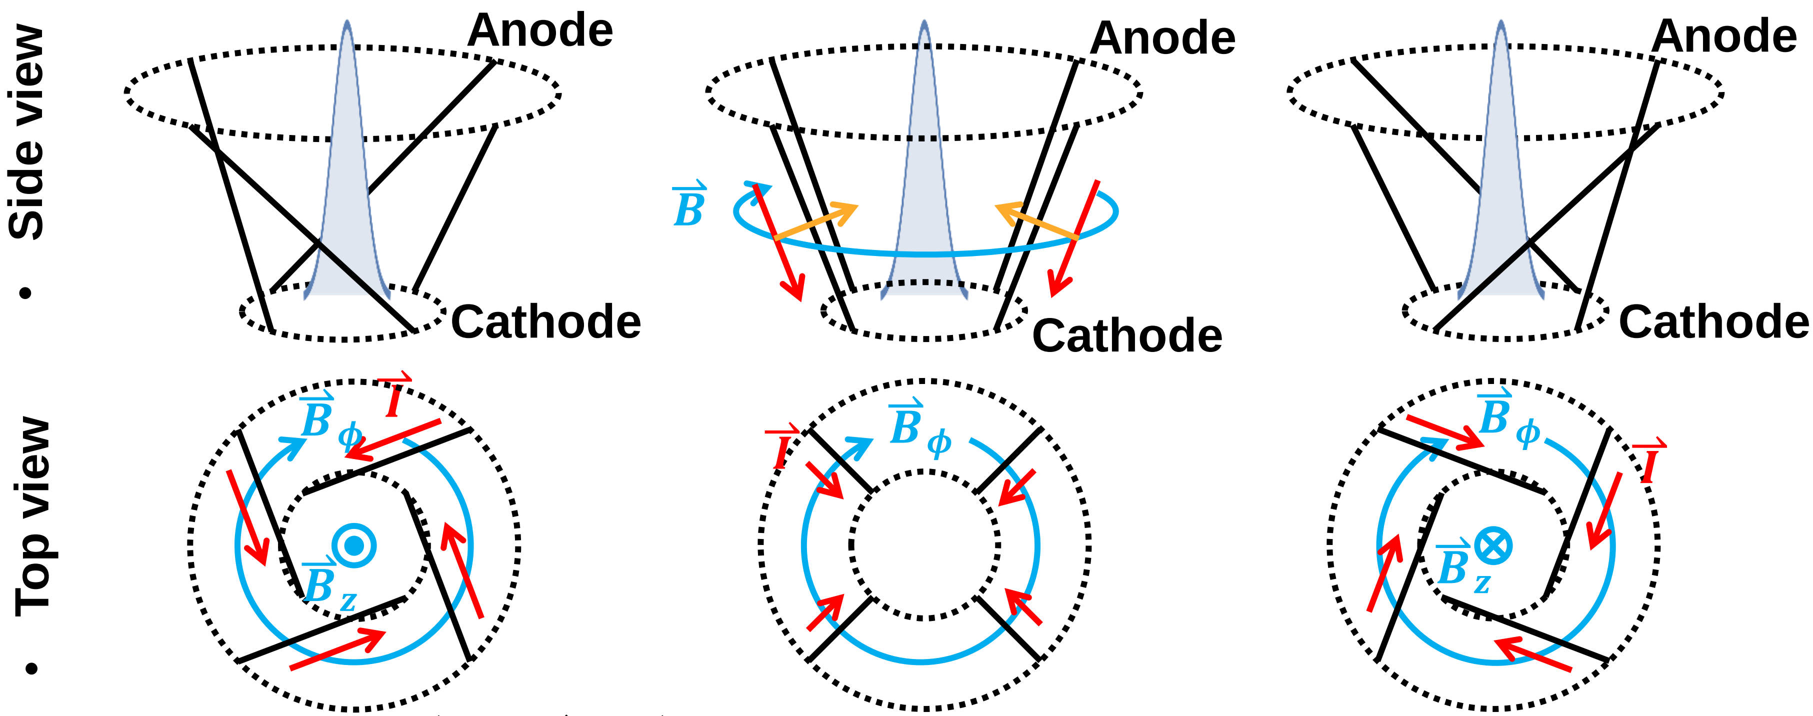




- **Material : Tungsten**
- **Number of wires : 4**
- **Diameter : 0.02 mm**

The rotational plasma jet produced by a twisted-conical-wire array is being studied

- Clockwise
- No rotation
- Counterclockwise



- No rotation: $\vec{F}_V = \vec{j} \times \vec{B} = (J_r, 0, J_z) \times (0, B_\phi, 0) = \hat{r}(-J_z B_\phi) + \hat{z}(J_r B_\phi)$
- With rotation: $\vec{F}_V = \vec{j} \times \vec{B} = (J_r, J_\phi, J_z) \times (B_r, B_\phi, B_z)$

$$= \hat{r}(J_\phi B_z - J_z B_\phi) + \hat{\phi}(J_z B_r - J_r B_z) + \hat{z}(J_r B_\phi - J_\phi B_z)$$

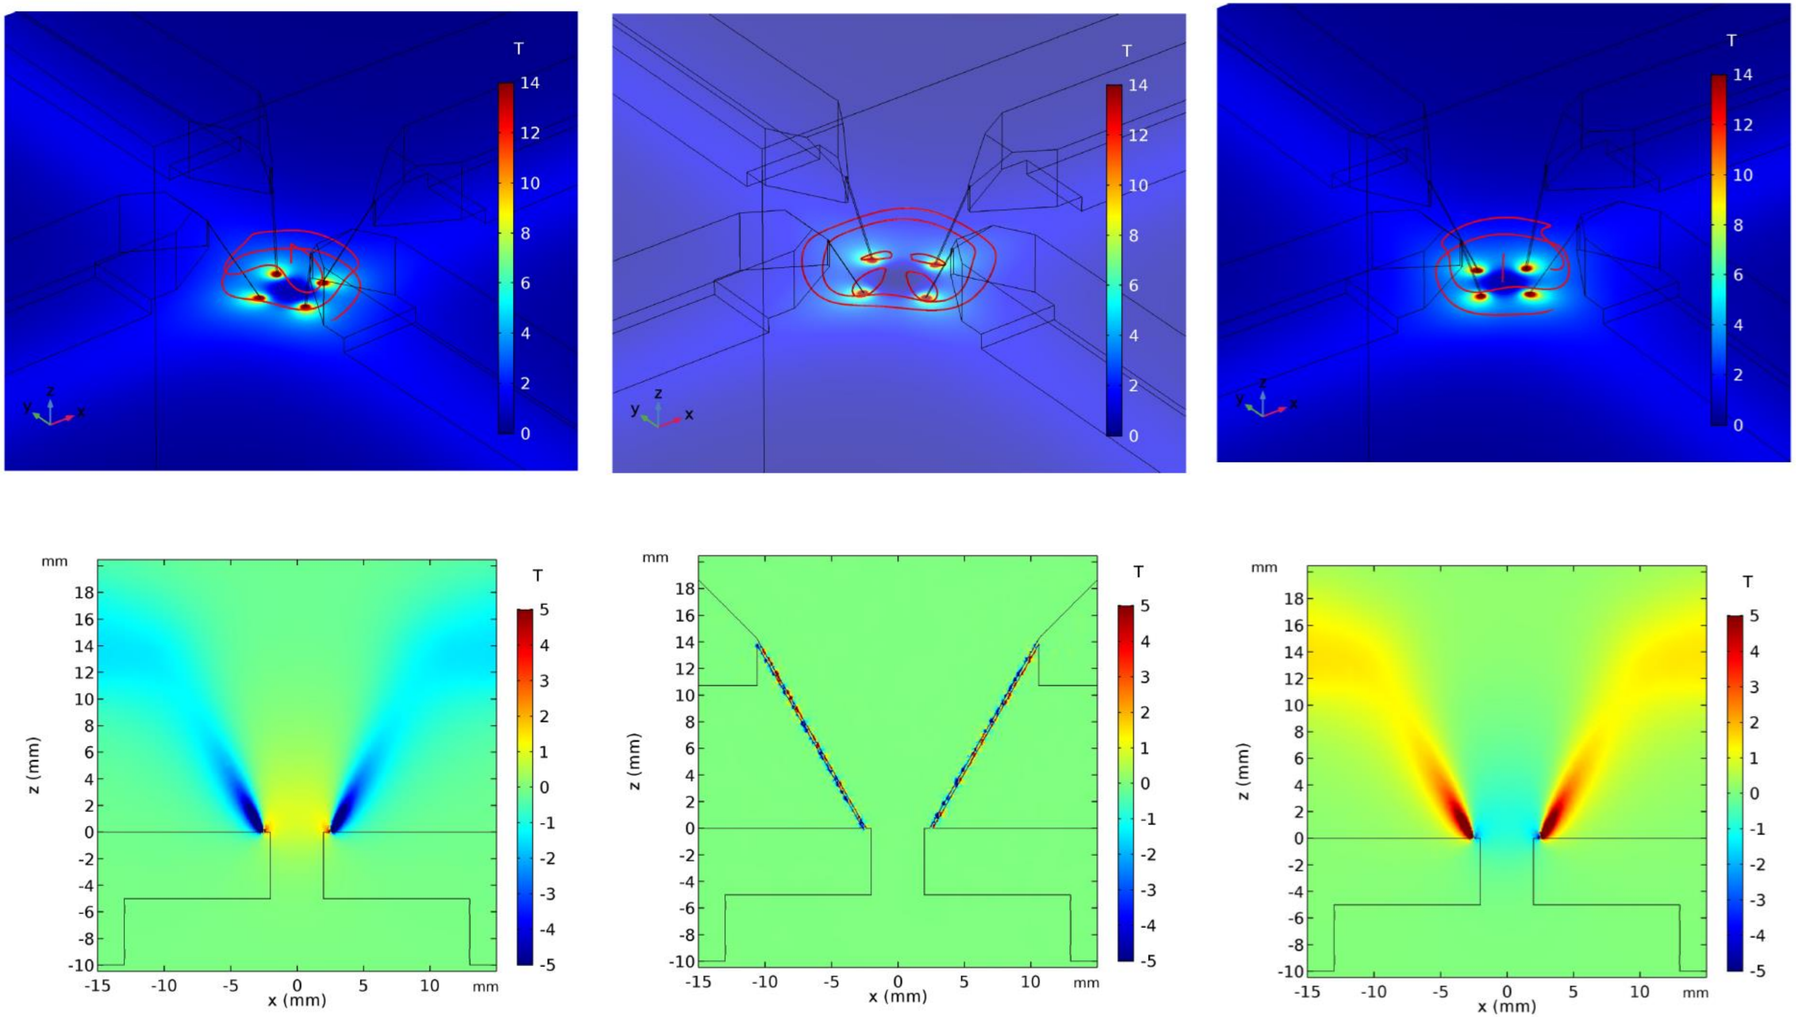
Compression Rotation

- CW: + + - - - + - + - - + +
- CCW: - - - - - - - - - - - -

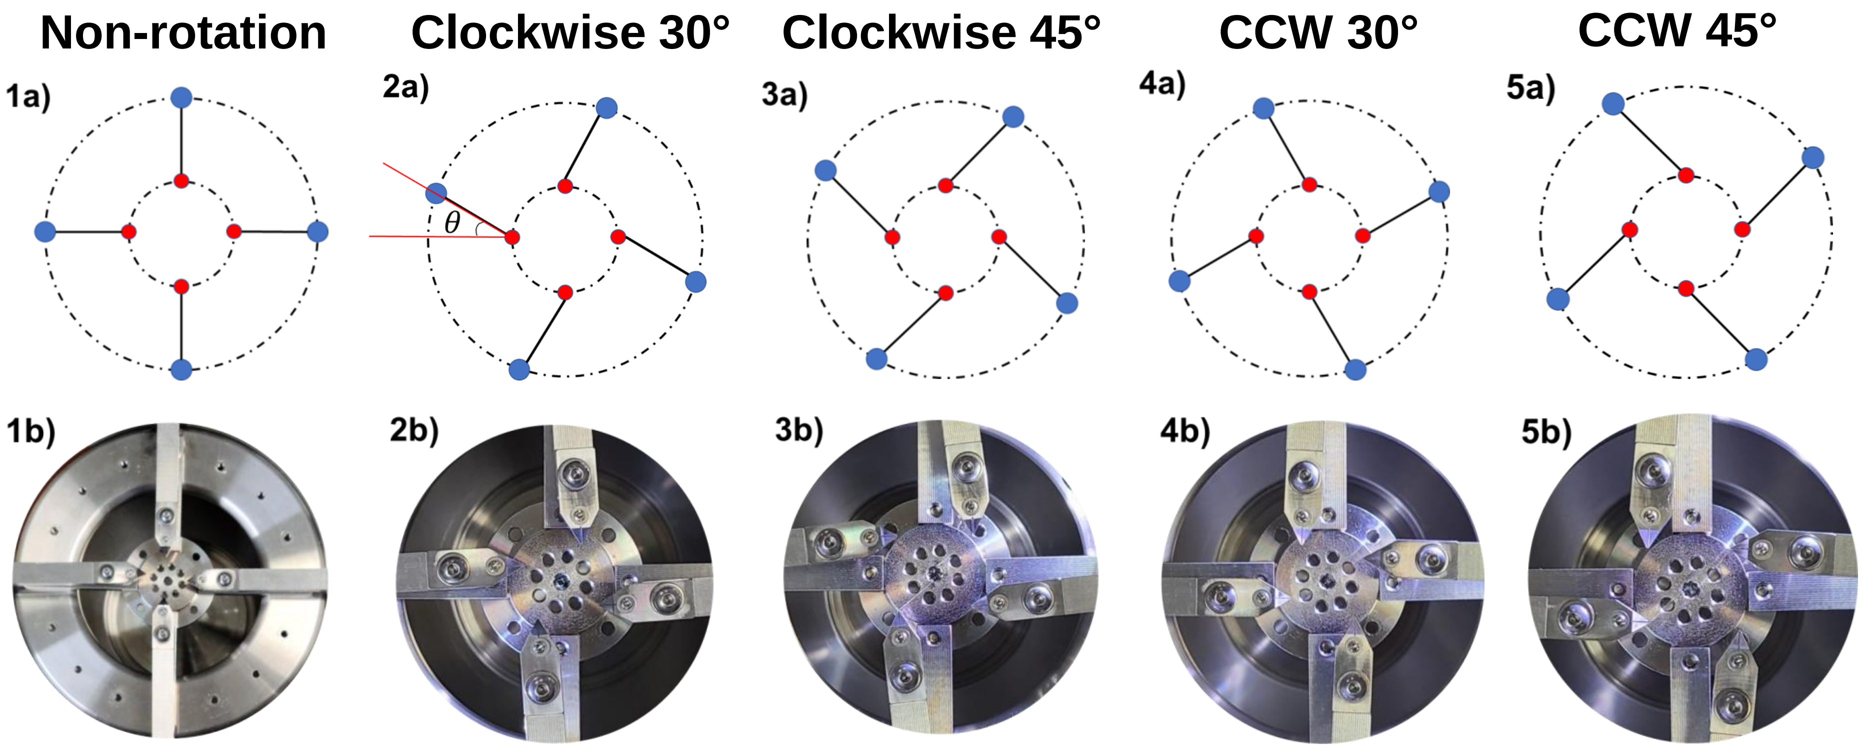
Bz is generated when the coil is twisted

- Clockwise
- No rotation
- Counterclockwise

- $\vec{B}$
- B_z

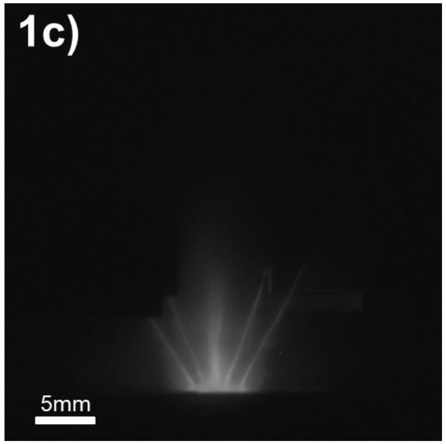


Conical-wire arrays were twisted with different angles and in different directions

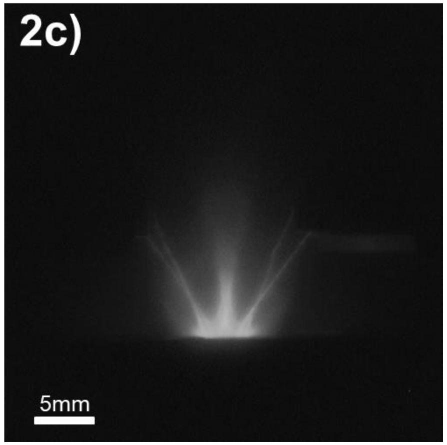


The brightness of the generated plasma jets depend on the twisted angle of the conical-wire array

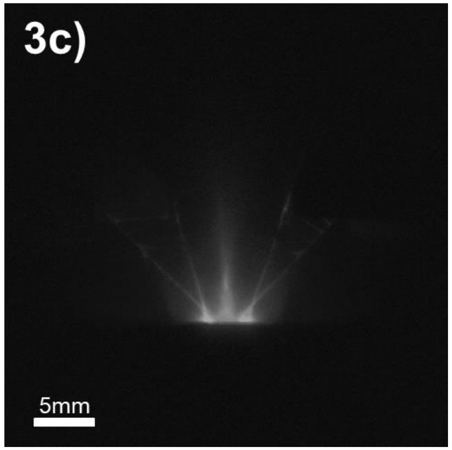
- Non-rotation



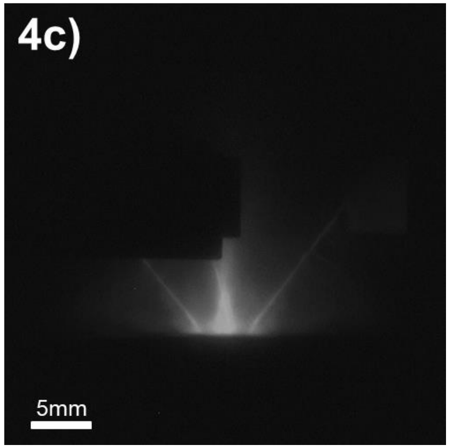
- Clockwise 30°



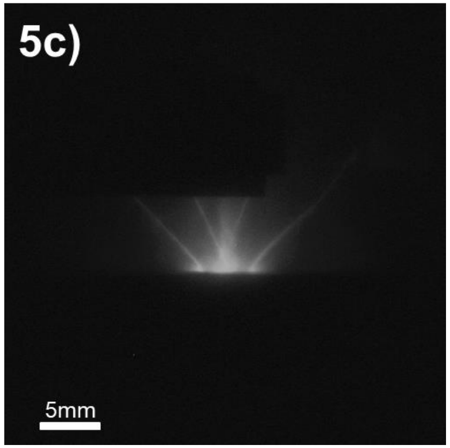
- Clockwise 45°



- CCW 30°

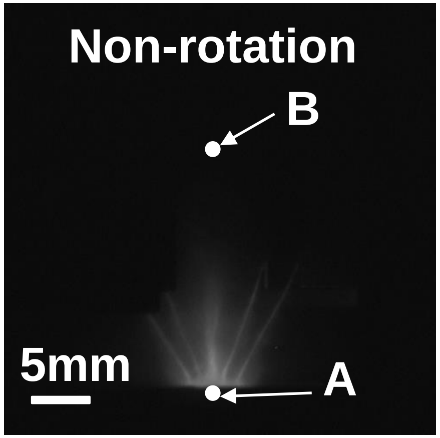


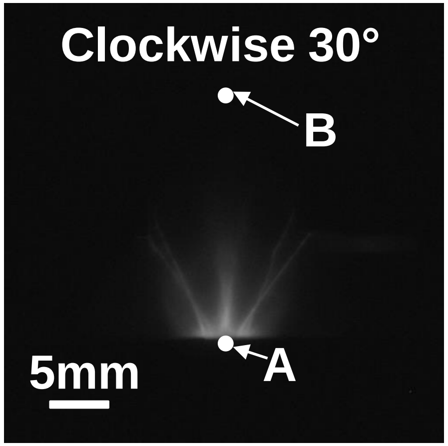
- CCW 45°

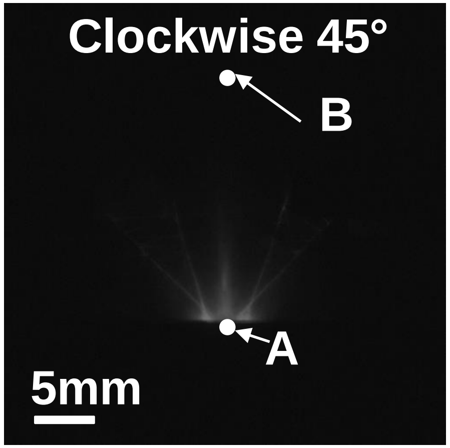


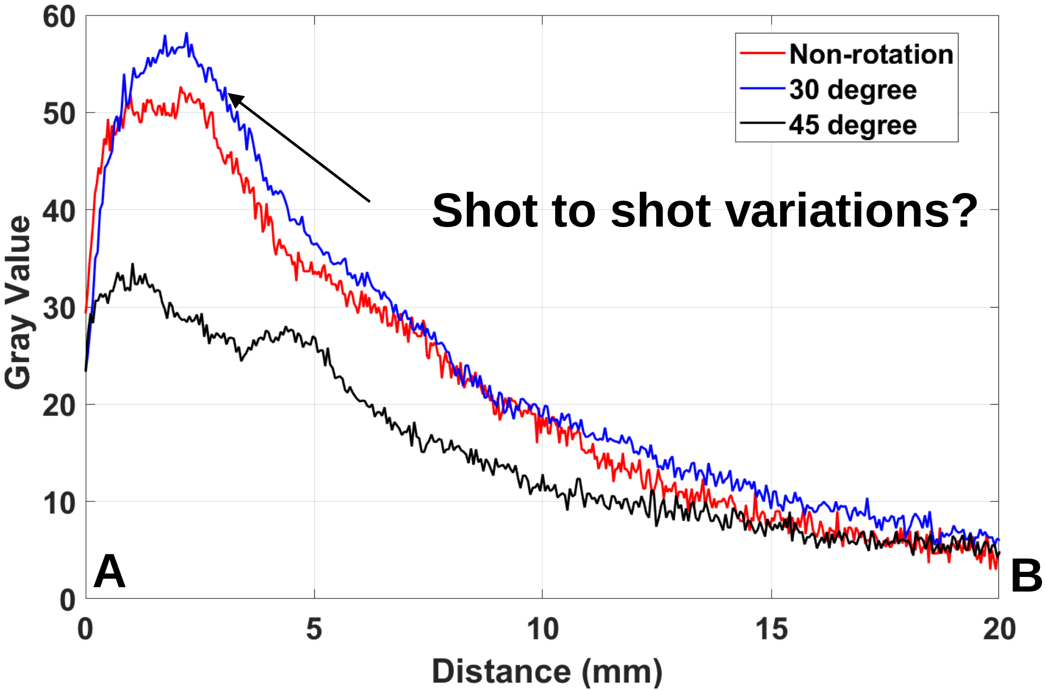
- The view of the plasma jet was blocked

The plasma jet with the twisted angle of 30º was the brightest



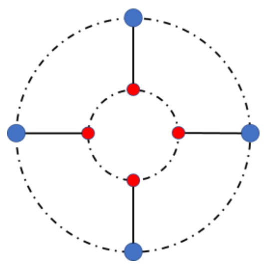


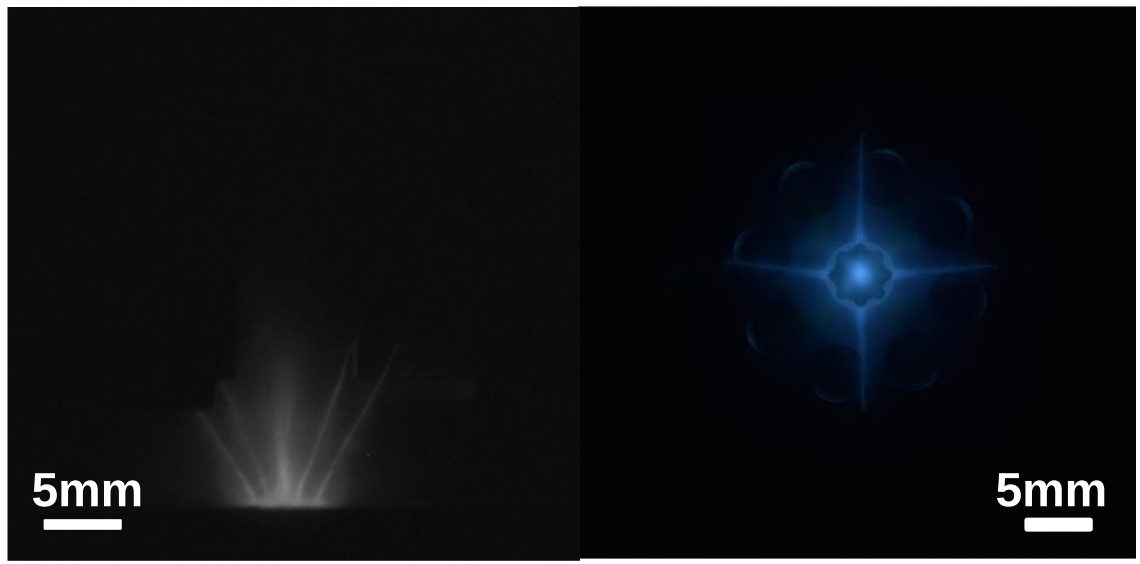




The plasma jet is a bright spot from the top view

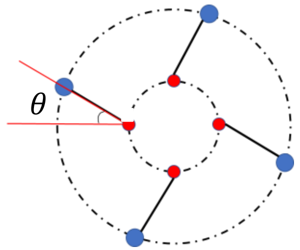
- **Non-rotation**

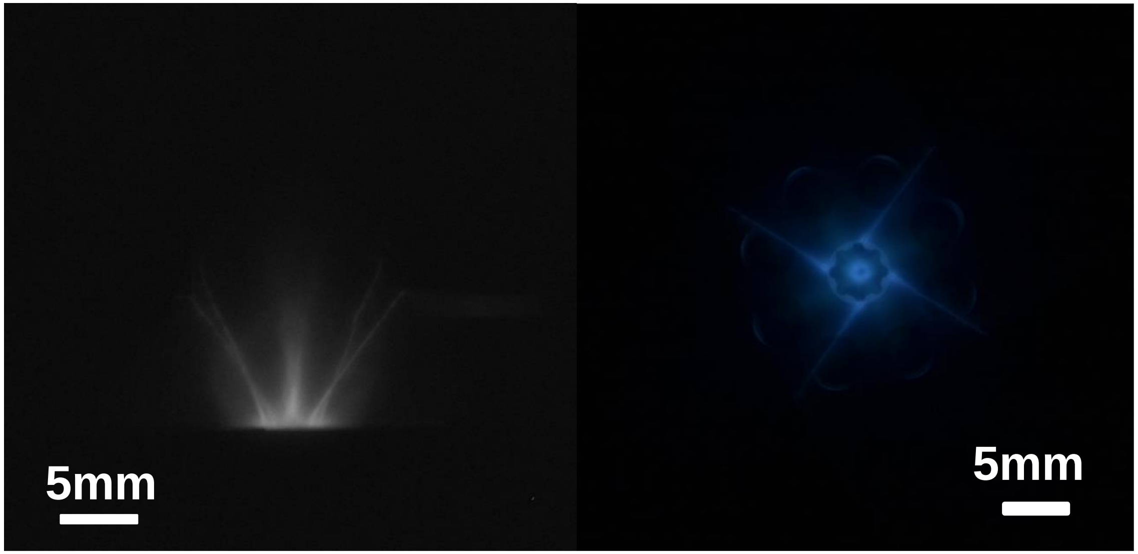




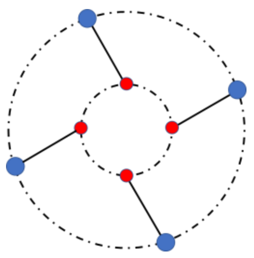
Hollow plasma jets were generated when the conical-wire arrays were twisted

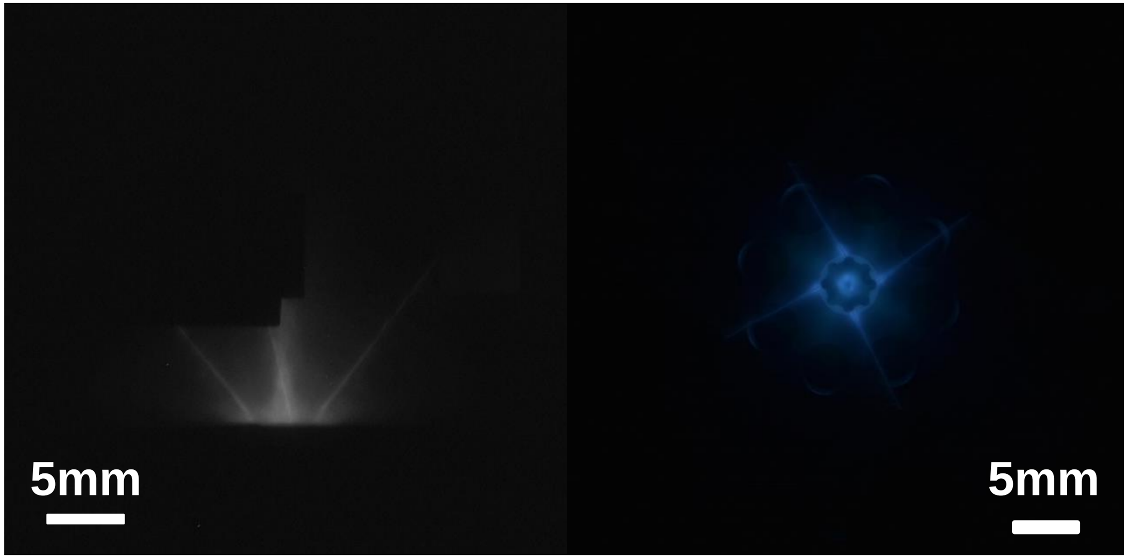
- **Clockwise 30 °**



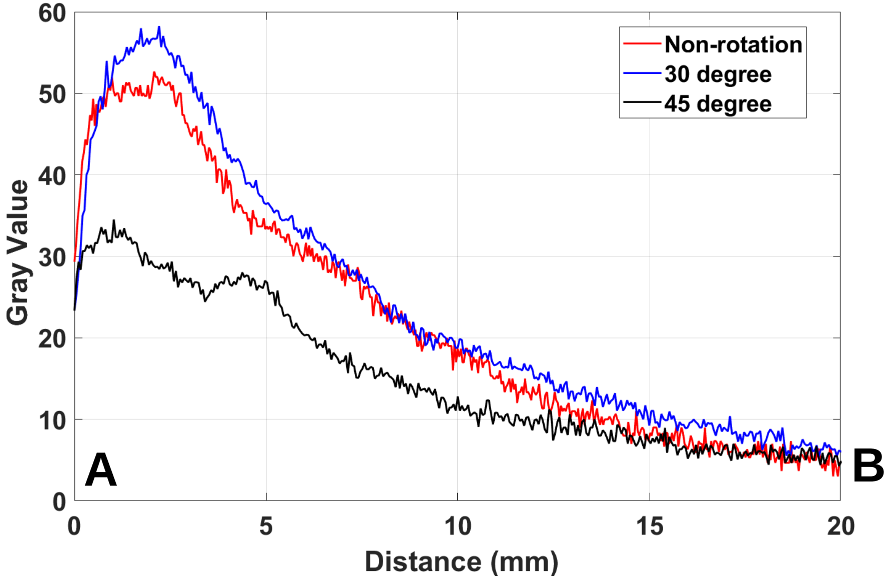


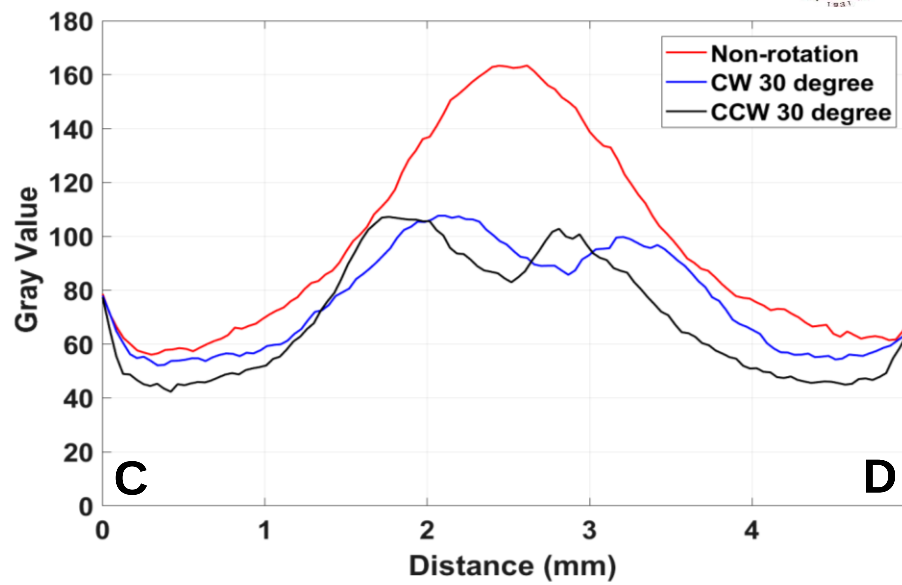
- **Counter clockwise 30 °**

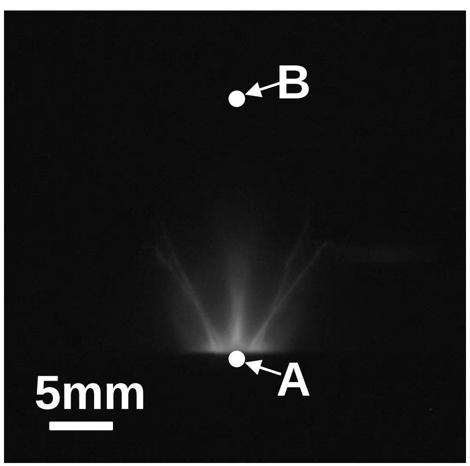




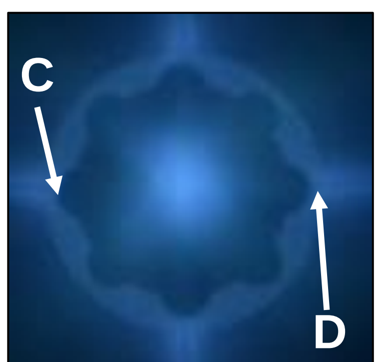
The hollow region at the center was due to angular momentum conservation of the in-coming plasma flow



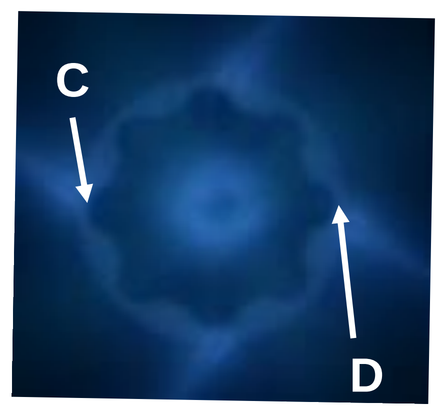




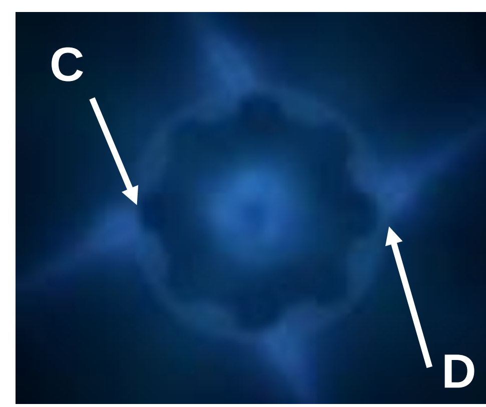
- 0 °



- CW 30 °



- CCW 30 °

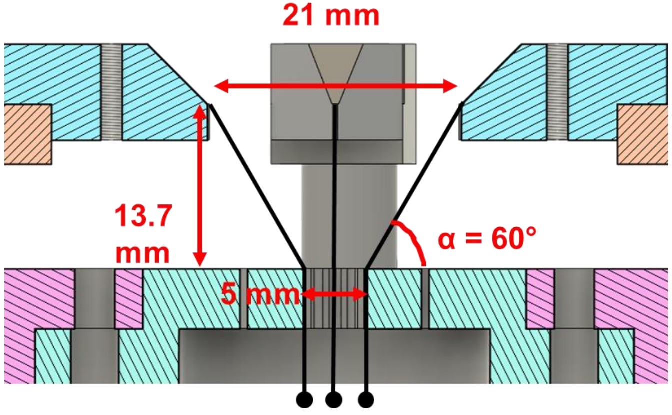


5mm

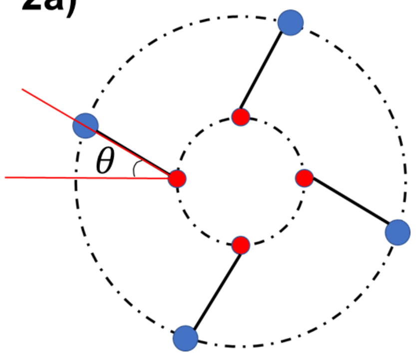
D. J. Ampleforda, et al., PRL 100, 035001 (2008)

Time-integrated images were not enough to capture the whole stories

- <u>The angular momentum is conserved:</u> larger initial angular momentum may lead to less compression.
- <u>Compression</u>: the magnetic field in the φ direction provides the $\vec{J} \times \vec{B}$ force to compress the plasma jet.
- <u>Heat conduction suppression</u>: the magnetic field in the z-direction may inhibit the thermal conduction losses. The temperature of the plasma jet may be higher leading to a brighter emission.
- <u>Radiation</u>: depends on temperature and density.



2a)



- **The time-resolved densities, temperatures, and magnetic fields of the plasma jets need to be measured.**

Can the angular momentum be cancelled out through collisions?

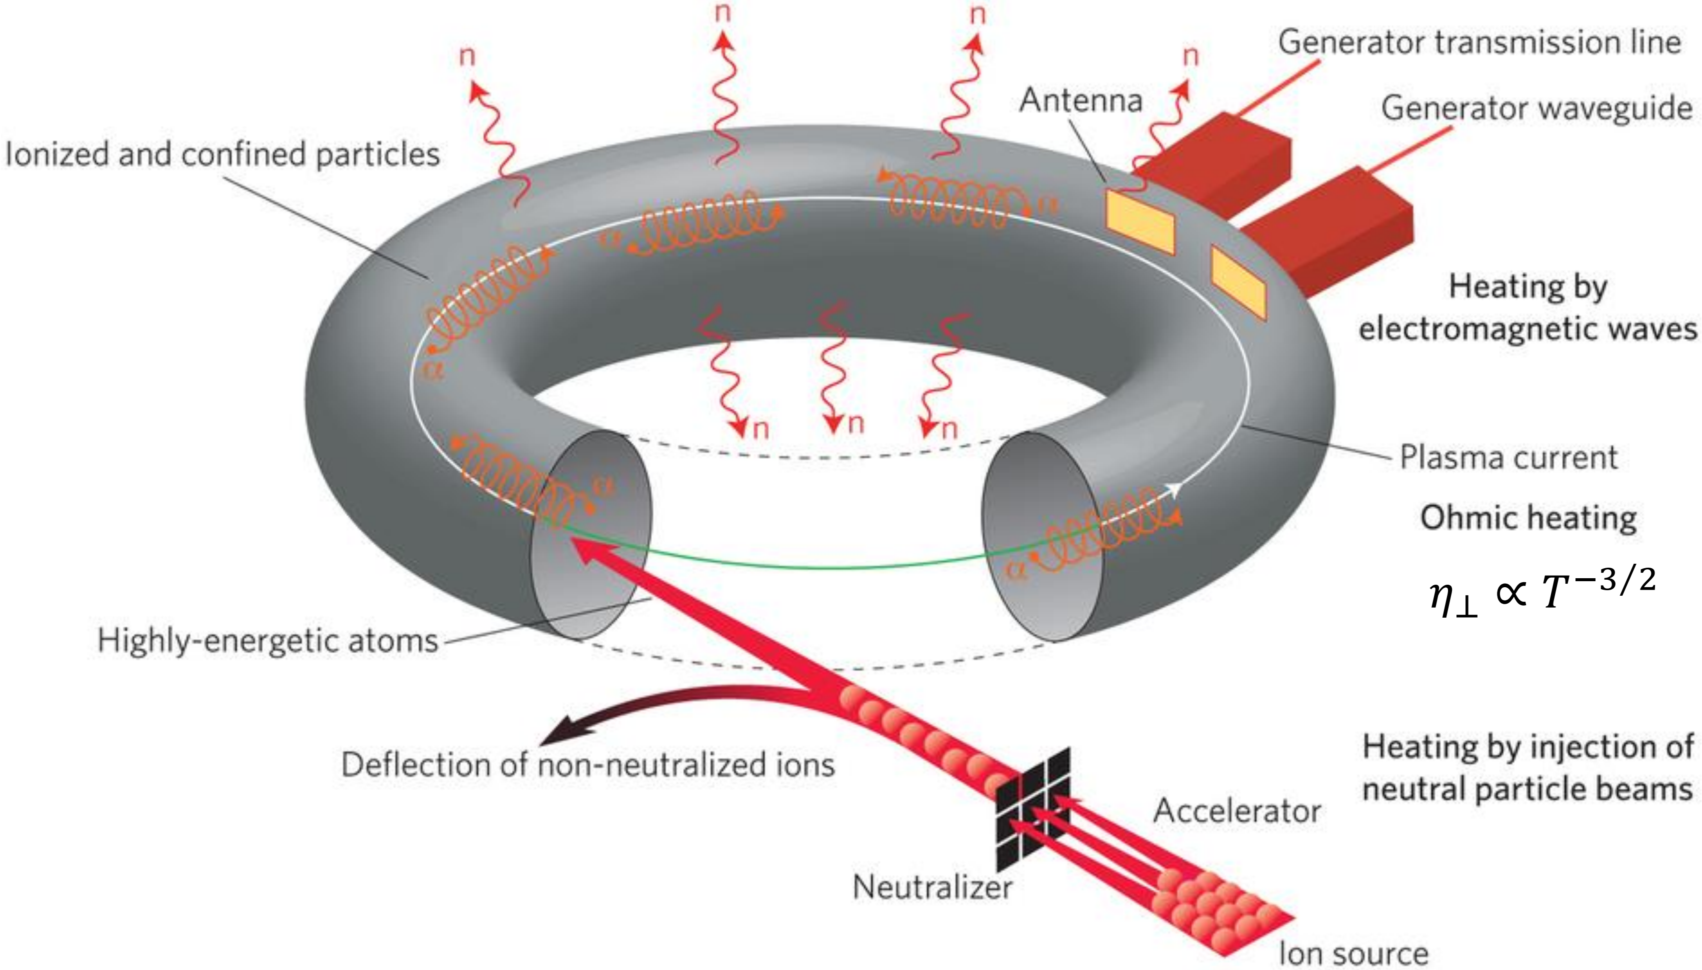
https://www.euro-fusion.org/jet/

Neutral beam injector is one of the main heat mechanisms in MCF



$$\eta_{\perp} \propto T^{-3/2}$$

D. Mazon, etc., NATURE PHYSICS, 12, 14, 2016

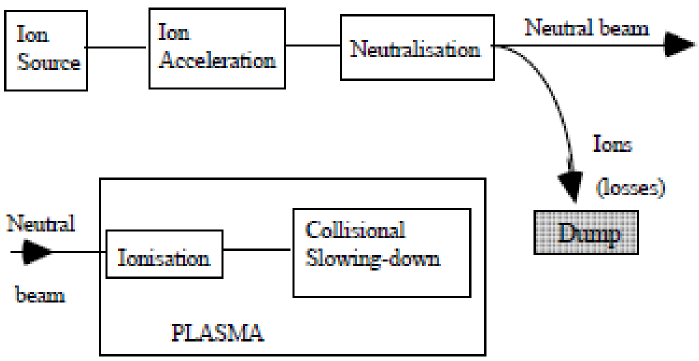
Varies way of heating a MCF device

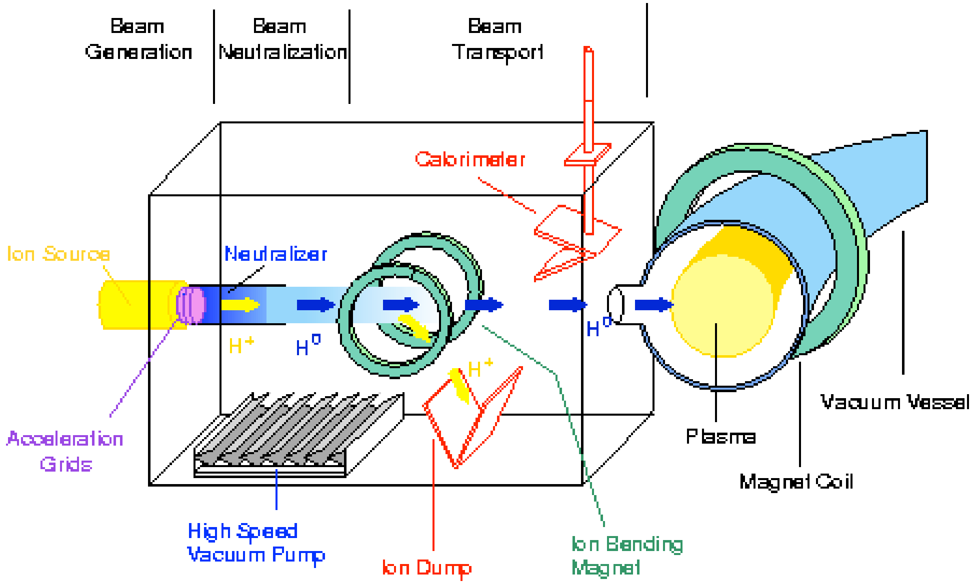
System		Frequency/ energy	Maximum power coupled to plasma	Overall system efficiency	Development/ demonstration required	Remarks
ECRF	Demonstrated in tokamaks	28–157 GHz	2.8 MW, 0.2 s	30–40%	Power sources and windows, off-axis CD	Provides off-axis CD
	ITER needs	150–170 GHz	50 MW, S S			
ICRF	Demonstrated in tokamaks	25–120 MHz	22 MW, 3 s (L-mode); 16.5 MW, 3 s (H-mode)	50–60%	ELM tolerant system	Provides ion heating and smaller ELMs
	ITER needs	40–75 MHz	50 MW, S S			
LHRF	Demonstrated in tokamaks	1.3–8 GHz	2.5 MW, 120 s; 10 MW, 0.5 s	45–55%	Launcher, coupling to H-mode	Provides off-axis CD
	ITER needs	5 GHz	50 MW, S S			
NBI +ve ion	Demonstrated in tokamaks	80–140 keV	40 MW, 2 s; 20 MW, 8 s	35–45%	None	Not applicable
	ITER needs	None	None			
NBI −ve ion	Demonstrated in tokamaks	0.35 MeV	5.2 MW, D^-, 0.8 s (from 2 sources)			
	ITER needs	1 MeV	50 MW, S S	∼37%	System, tests on tokamak, plasma CD	provides rotation

'S S' indicates steady state

Nuclear Fusion, 39, 2495, 1999

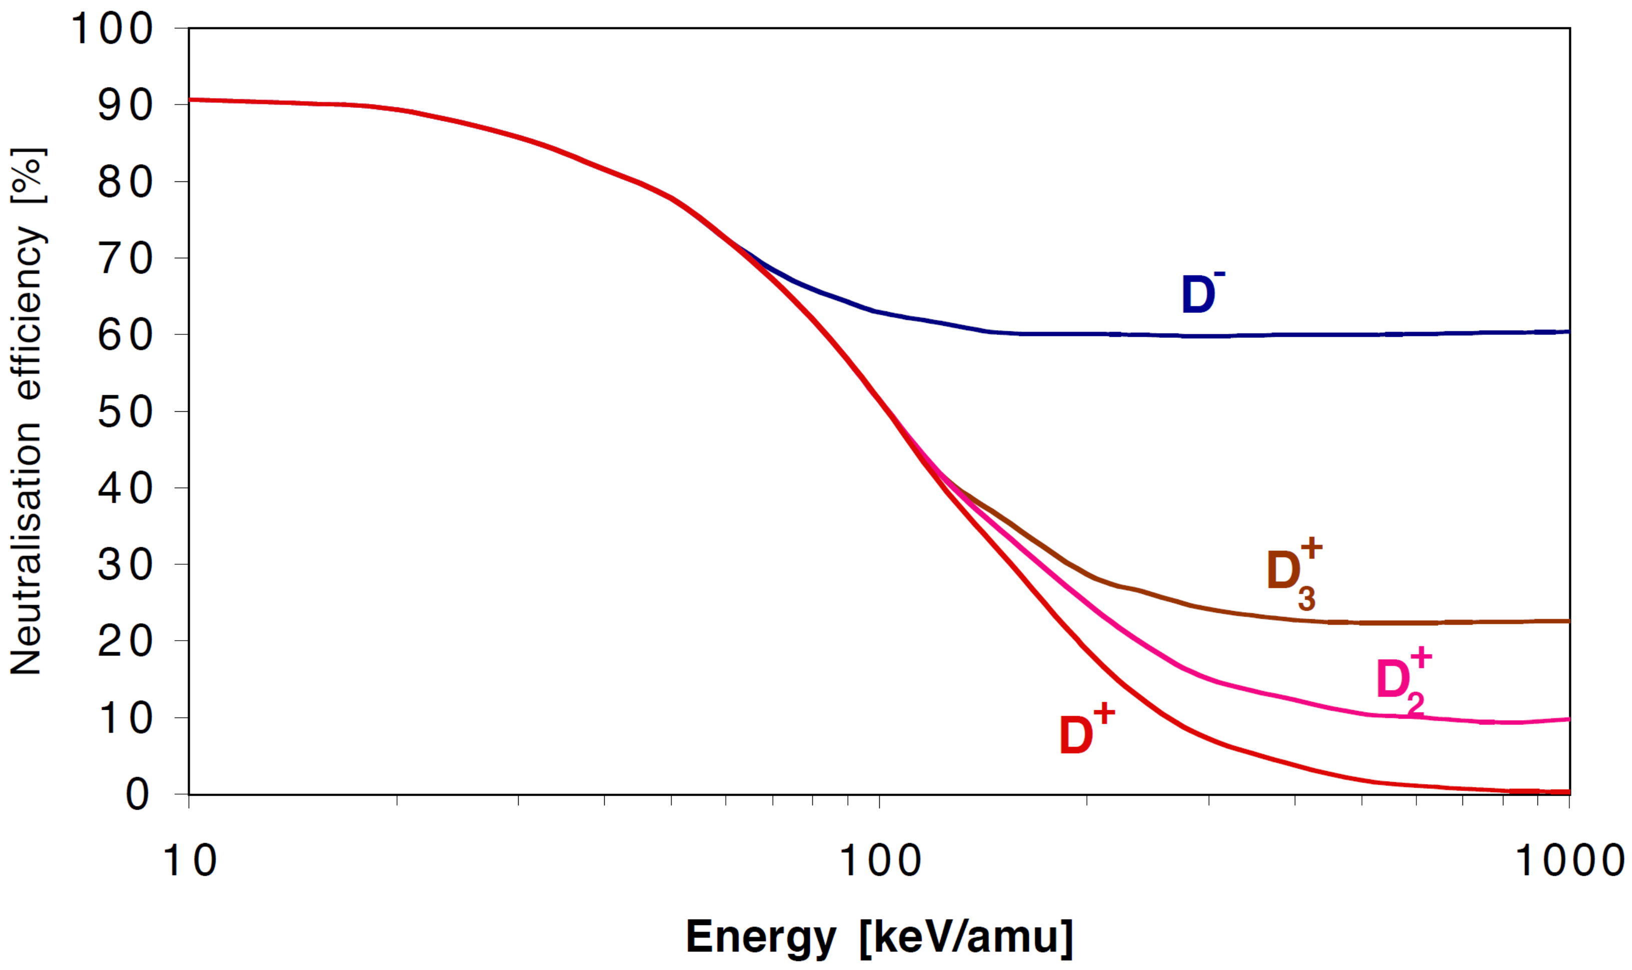
Neutral particles heat the plasma via coulomb collisions





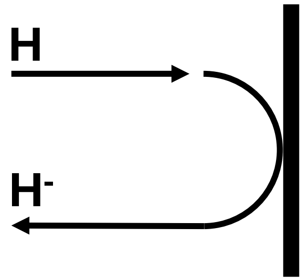
1. **create energetic (fast) neutral ions**
2. **ionize the neutral particles**
3. **heat the plasma (electrons and ions) via Coulomb collisions**

Negative ion source is preferred due to higher neutralization efficiency



There are two ways to make negative ions – surface and volume production

- **Surface production, depends on :**
  - **Work function Φ**
  - **Electron affinity level, 0.75 eV for H$^-$**
  - **Perpendicular velocity**
  - **Work function can be reduced by covering the metal surface with cesium**



$$\boldsymbol{H + e^- \longrightarrow H^-}$$

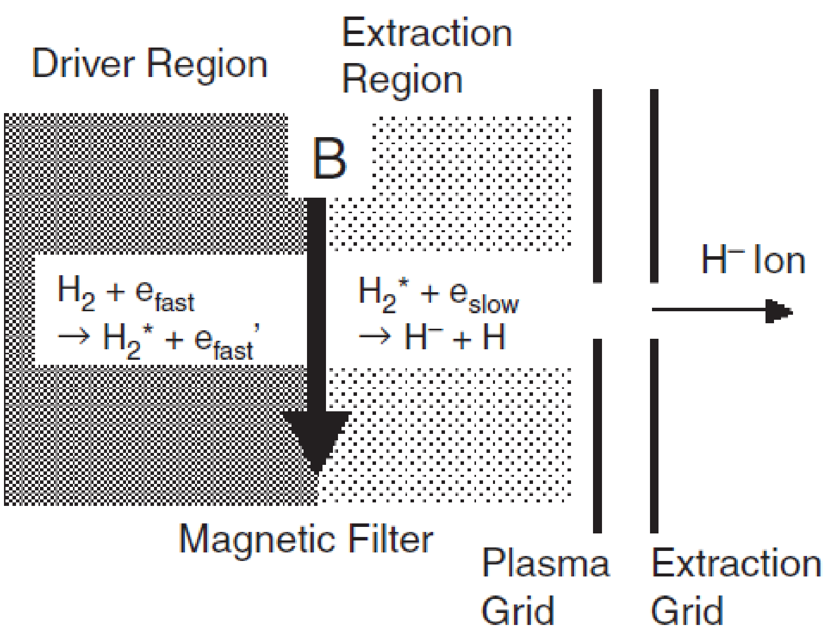
$$\boldsymbol{H^+ + 2e^- \longrightarrow H^-}$$

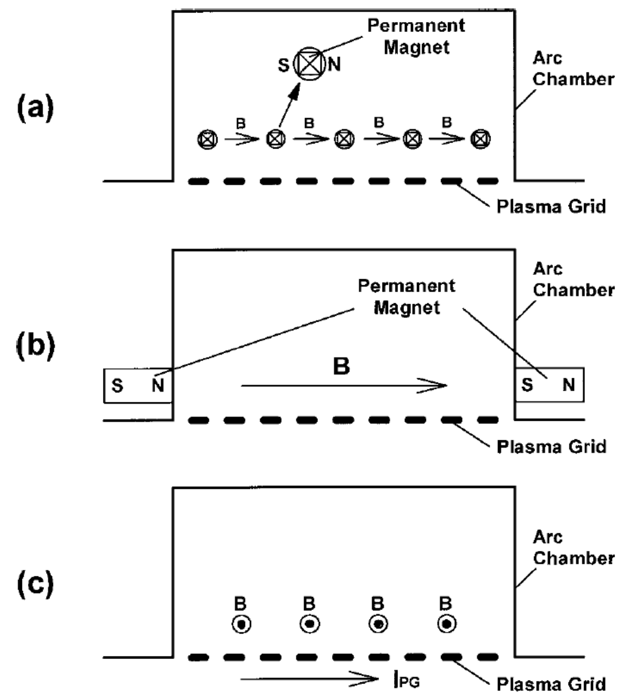
- **Volume production:**

$$\mathrm{H_2} + \mathrm{e}_{fast}(>20\ \mathrm{eV}) \rightarrow \mathrm{H_2}^*(\text{excited state}) + \mathrm{e}_{fast},$$

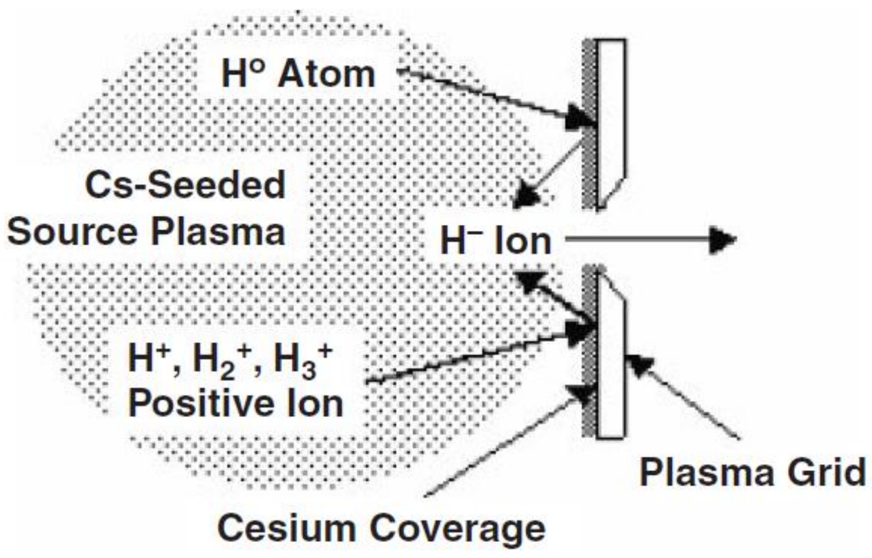
$$\mathrm{H_2}^*(\text{excited state}) + \mathrm{e}_{slow}(\approx 1\ \mathrm{eV}) \rightarrow \mathrm{H}^- + \mathrm{H}.$$

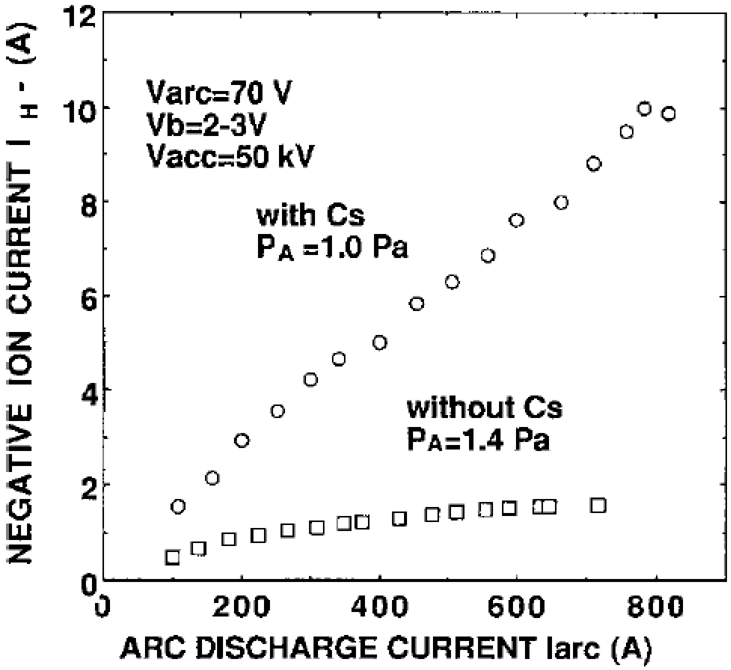
Two-chamber method of negative ions in volume production with a magnetic filter



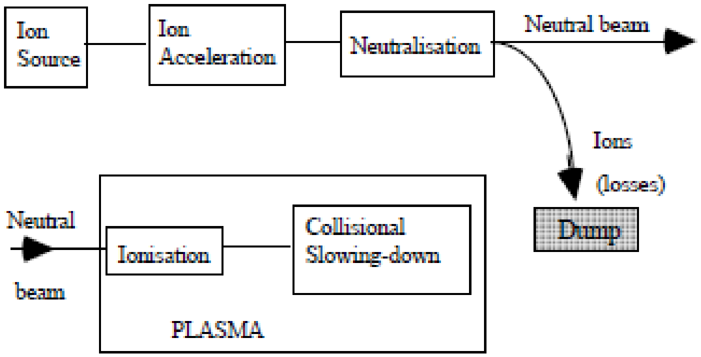


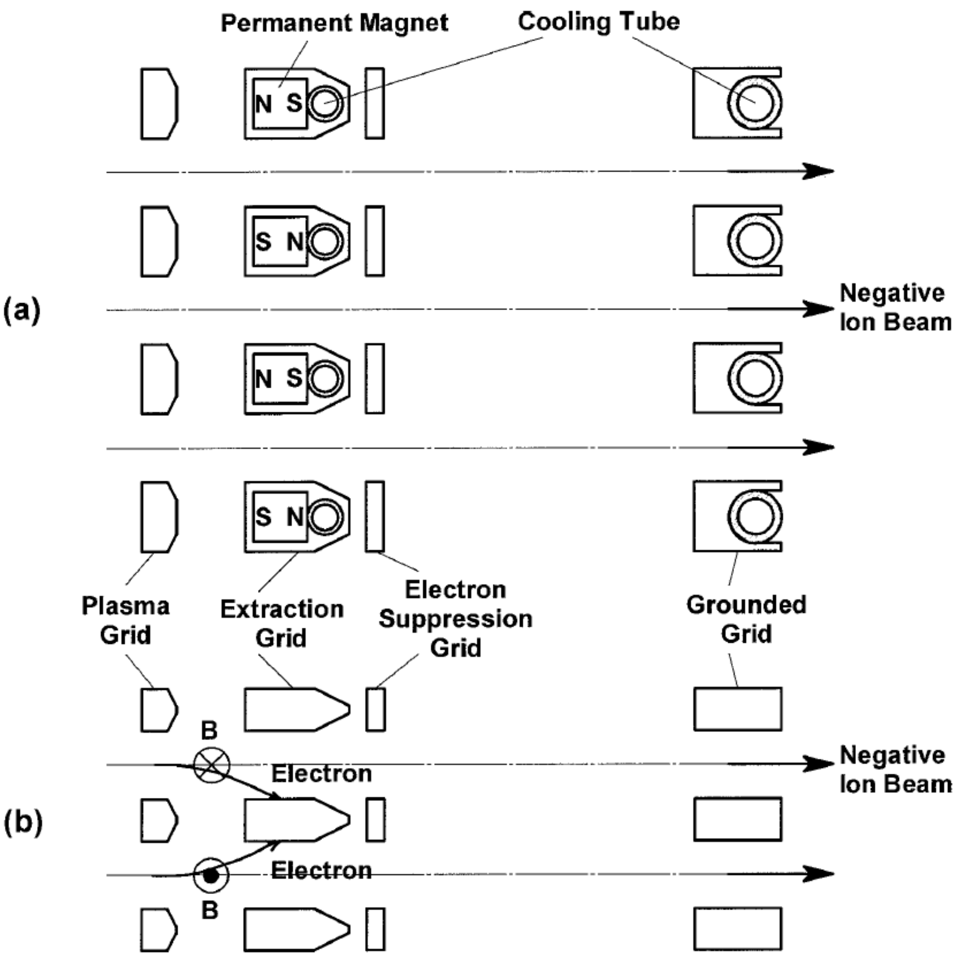
Adding cesium increases negative ion current





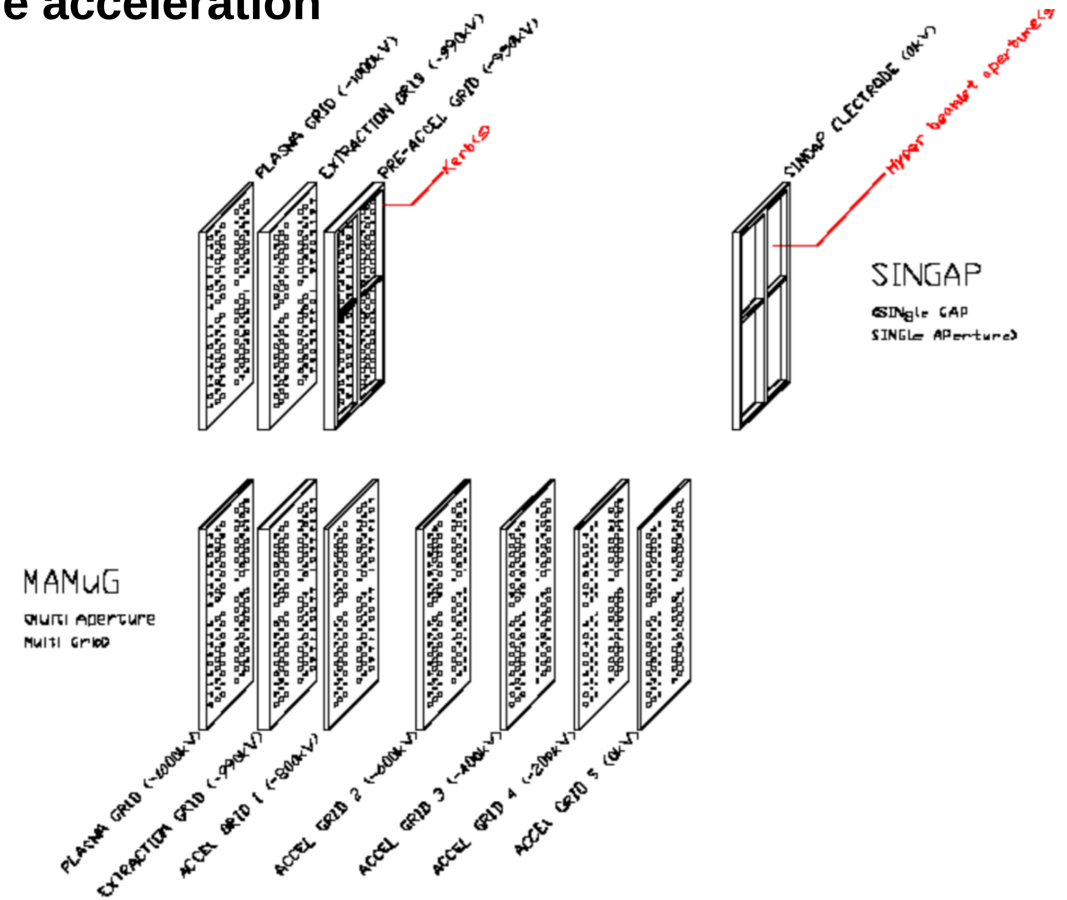
Electrons need to be filtered out since they are extracted together with negative ions





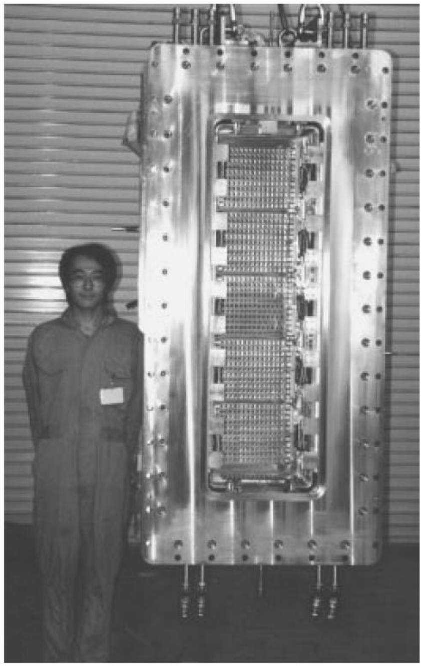
Acceleration

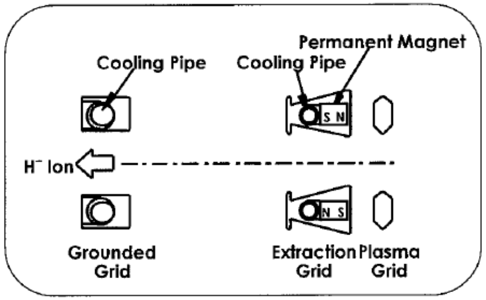
- **Multi-stage acceleration**
- **Single-stage acceleration**



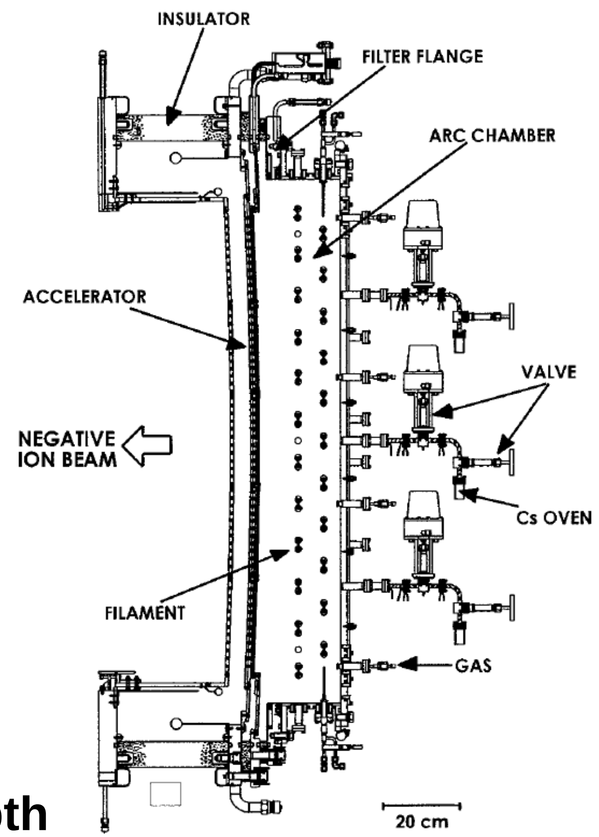
The ITER neutral beam system: status of the project and review of the main technological issues, presented by V. Antoni

NBI system of the LHD fusion machine





Negative Ion Accelerator

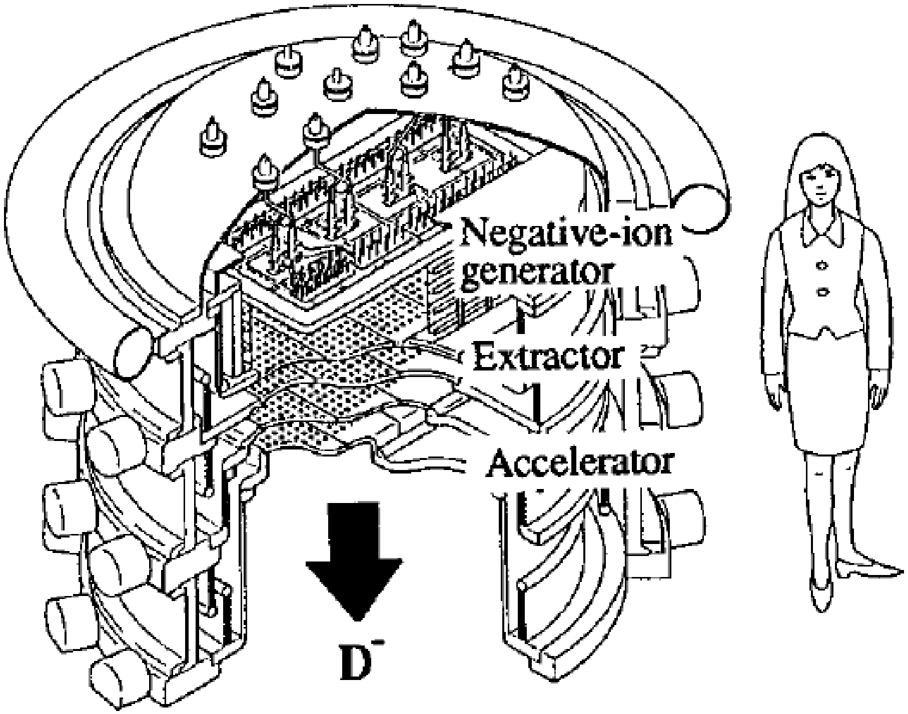


- 180 keV and 30 A
- Arc chamber: 35 cm x 145 cm, 21cm in depth
- Single stage accelerator

Y. Takeiri, etc., Nucl. Fusion, 46, S199, 2006

JT60U NBI system

- JT-60 (Japan-Torus) is a tokamak in Japan.
- 550 keV, 22A
- 2m in diameter and 1.7 m in height
- 3-stage accelerator



Neutralization

- **Gas neutralization**
  - **Collisions between fast negative ions and atoms**

$$H^- + H_2 \longrightarrow H + H_2 + e^-$$

  - **Fast ions can lose another electron after neutralized**

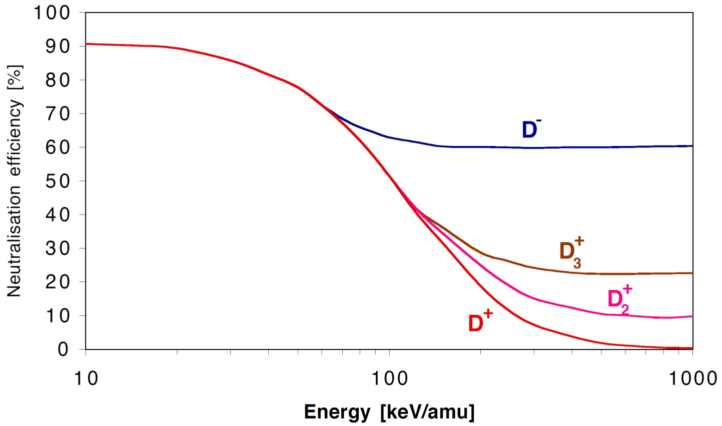
$$H + H_2 \longrightarrow H^+ + H_2 + e^-$$

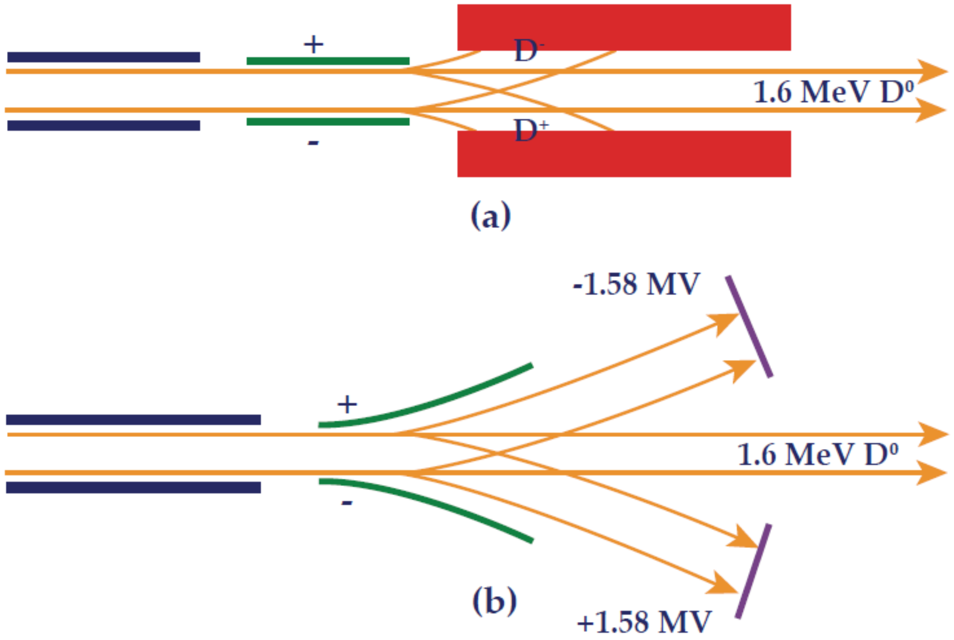
- **Plasma neutralization**
  - **Collisions with charged particles in plasma**

$$H^- + X(e, \mathrm{Ar}, H^+, {H_2}^+) \longrightarrow H + X + e^-$$

  - **The efficiencies reach up to 85% for fully ionized hydrogen plasma**

Beam dump

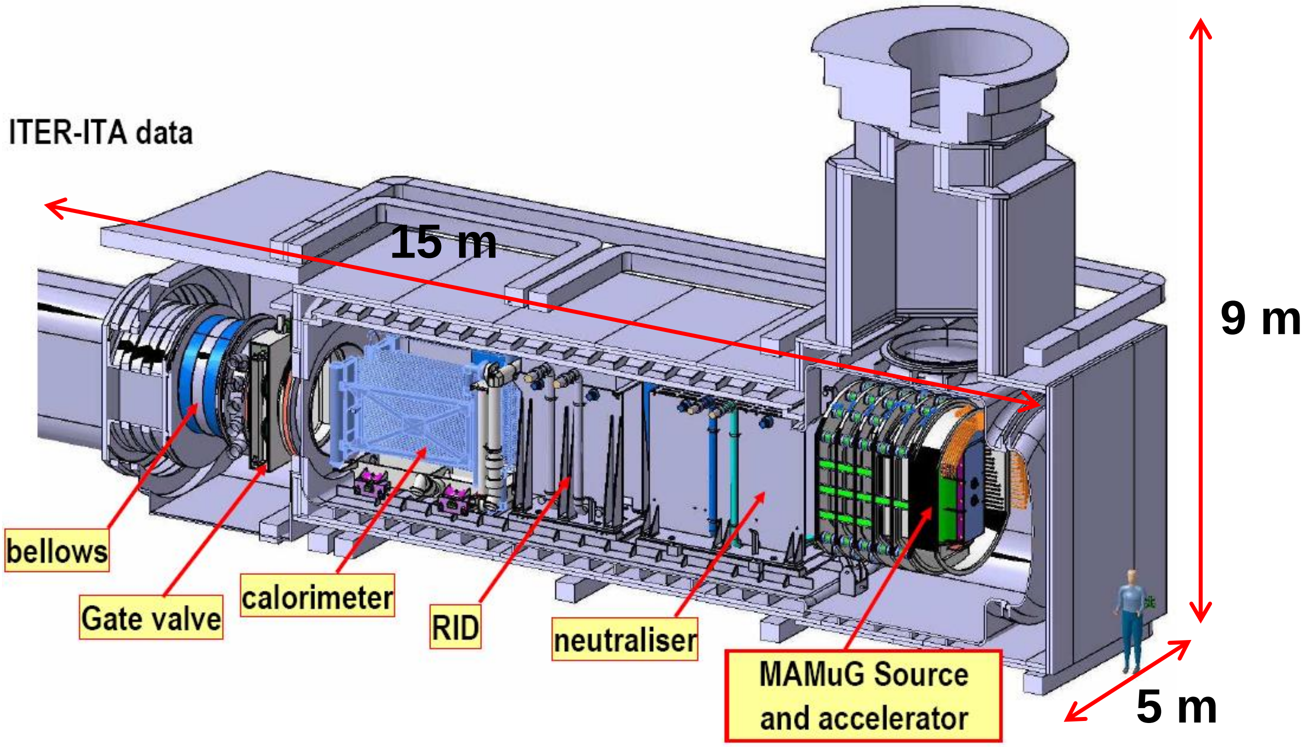




R. W. Moir, Fusion Technology, 25, 129, 1994

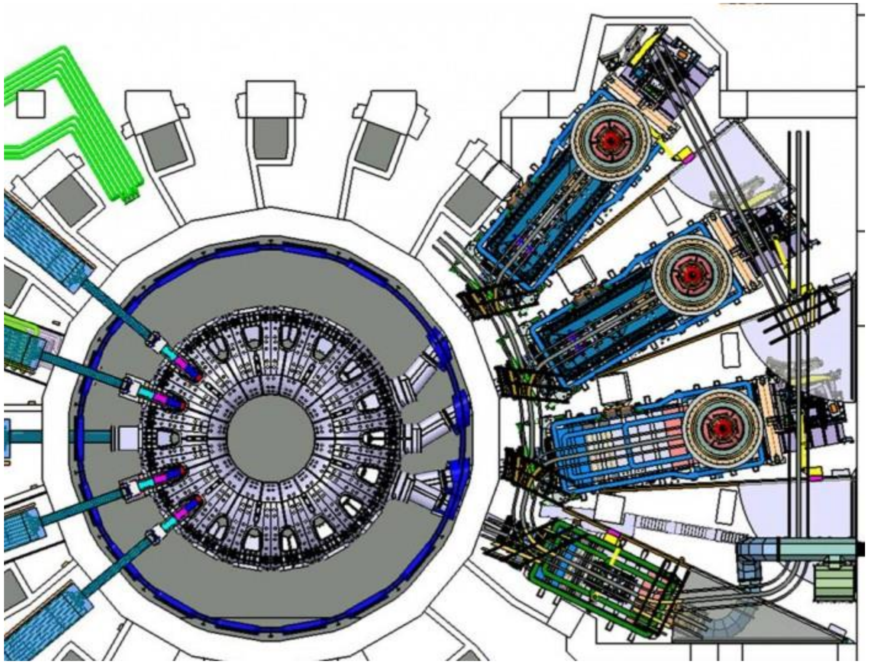
NBI for ITER

- **beam components (Ion Source, Accelerator, Neutralizer, Residual Ion Dump and Calorimeter)**
- **other components (cryo-pump, vessels, fast shutter, duct, magnetic shielding, and residual magnetic field compensating coils)**



The ITER neutral beam system: status of the project and review of the main technological issues, presented by V. Antoni

Neutral beam penetration



- **Parallel direction**
  - **Longest path through the densest part of the plasma**
  - **Harder to be built**
- **Perpendicular direction**
  - **Path is short**
  - **Larger perpendicular energies leads to larger losses**
  - **Easier to be built**

The thrust in an ion engine is transferred by the electrostatic force between the ions and the two grids

$$\frac{dE(x)}{\mathrm{dx}} = \frac{\rho(x)}{\varepsilon_0} = \frac{\mathrm{q}\mathrm{n}_i(x)}{\varepsilon_0}$$

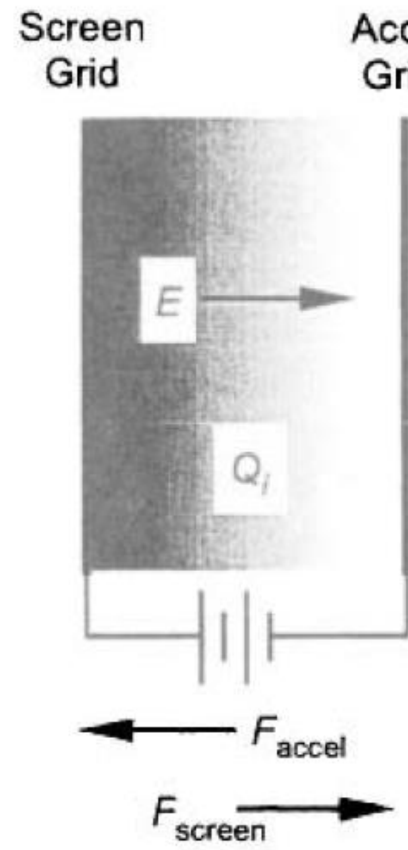
$$E(x) = \frac{q}{\varepsilon_0}\int_0^x n_i(x')\mathrm{dx}' + E_{\mathrm{screen}}$$

Gauss's law: $\sigma = \varepsilon_0 E_{\mathrm{screen}}$

$$F_{\mathrm{screen}} = \sigma\frac{(E_{\mathrm{screen}} + 0)}{2} = \frac{1}{2}\varepsilon_0 {E_{\mathrm{screen}}}^2$$

$$F_{\mathrm{accel}} = -\sigma\frac{(E_{\mathrm{accel}} + 0)}{2} = -\frac{1}{2}\varepsilon_0 {E_{\mathrm{accel}}}^2$$

$$T = F_{\mathrm{screen}} + F_{\mathrm{accel}} = \frac{1}{2}\varepsilon_0\left({E_{\mathrm{screen}}}^2 - {E_{\mathrm{accel}}}^2\right)$$



$$F_{\mathrm{ion}} = q\int_0^d n_i(x)E(x)\mathrm{dx} = \varepsilon_0\int_0^d \frac{dE}{\mathrm{dx}}\mathrm{Edx} == \frac{1}{2}\varepsilon_0\left({E_{\mathrm{accel}}}^2 - {E_{\mathrm{screen}}}^2\right)$$

The rocket equation

$$\text{Force} = T = M\frac{\mathrm{dv}}{\mathrm{dt}}$$

$$T = -\frac{d}{\mathrm{dt}}\left(m_p v_{\mathrm{ex}}\right) = -v_{\mathrm{ex}}\frac{\mathrm{dm}_p}{\mathrm{dt}}$$

$$M(t) = m_d + m_p$$

$$\frac{dM}{\mathrm{dt}} = \frac{\mathrm{dm}_p}{\mathrm{dt}}$$

$$M\frac{\mathrm{dv}}{\mathrm{dt}} = -v_{\mathrm{ex}}\frac{\mathrm{dM}}{\mathrm{dt}}$$

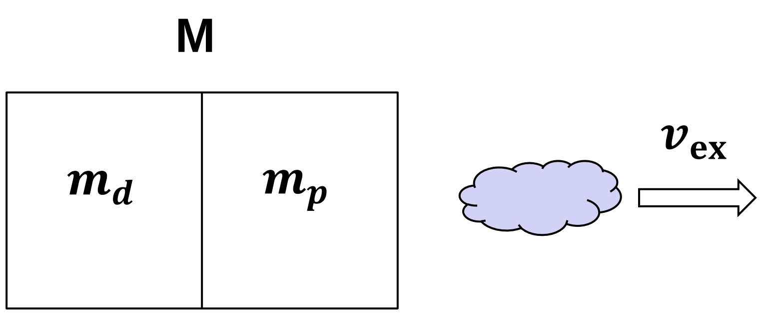
$$\int_{v_i}^{v_f}\mathrm{dv} = -v_{\mathrm{ex}}\int_{m_d+m_p}^{m_d}\frac{\mathrm{dM}}{M}$$

$$v_f - v_i = \Delta\mathrm{v} = -v_{\mathrm{ex}}\ln\left(\frac{m_d}{m_d+m_p}\right)$$

$$m_d = \left(m_d+m_p\right)e^{-\Delta\mathrm{v}/v_{\mathrm{ex}}}$$

$$\boxed{\Delta\mathrm{v} = (\mathrm{Isp}\times g)\ln\left(\frac{m_d+m_p}{m_d}\right)}$$

$$\boxed{\begin{aligned} m_p &= m_d\left[e^{\Delta\mathrm{v}/v_{\mathrm{ex}}} - 1\right] \\ &= m_d\left[e^{\Delta\mathrm{v}/(\mathrm{Isp}\times g)} - 1\right] \end{aligned}}$$



Force transfer

$$T = -\frac{d}{\mathrm{dt}}(m_p v_{\mathrm{ex}}) = -v_{\mathrm{ex}}\frac{\mathrm{dm}_p}{\mathrm{dt}} = \dot{m}_p v_{ex}$$

$$\dot{m}_p = \mathrm{QM}$$

$\dot{m}_p$ = propellant mass flow rate in kg/s

Q = propellant particle flow rate in particles/s

M = atomic mass in kg

$$P_{\mathrm{jet}} = \frac{1}{2}\dot{m}_p {v_{\mathrm{ex}}}^2 = \frac{T^2}{2\dot{m}_p}$$

$$T = \frac{\mathrm{dm}_p}{\mathrm{dt}} v_{\mathrm{ex}} \approx \dot{m}_i v_i$$

$\dot{m}_i$ = ion mass flow rate in kg/s

I_b = ion current

$$v_i = \sqrt{\frac{2\mathrm{qV}_b}{M}}$$

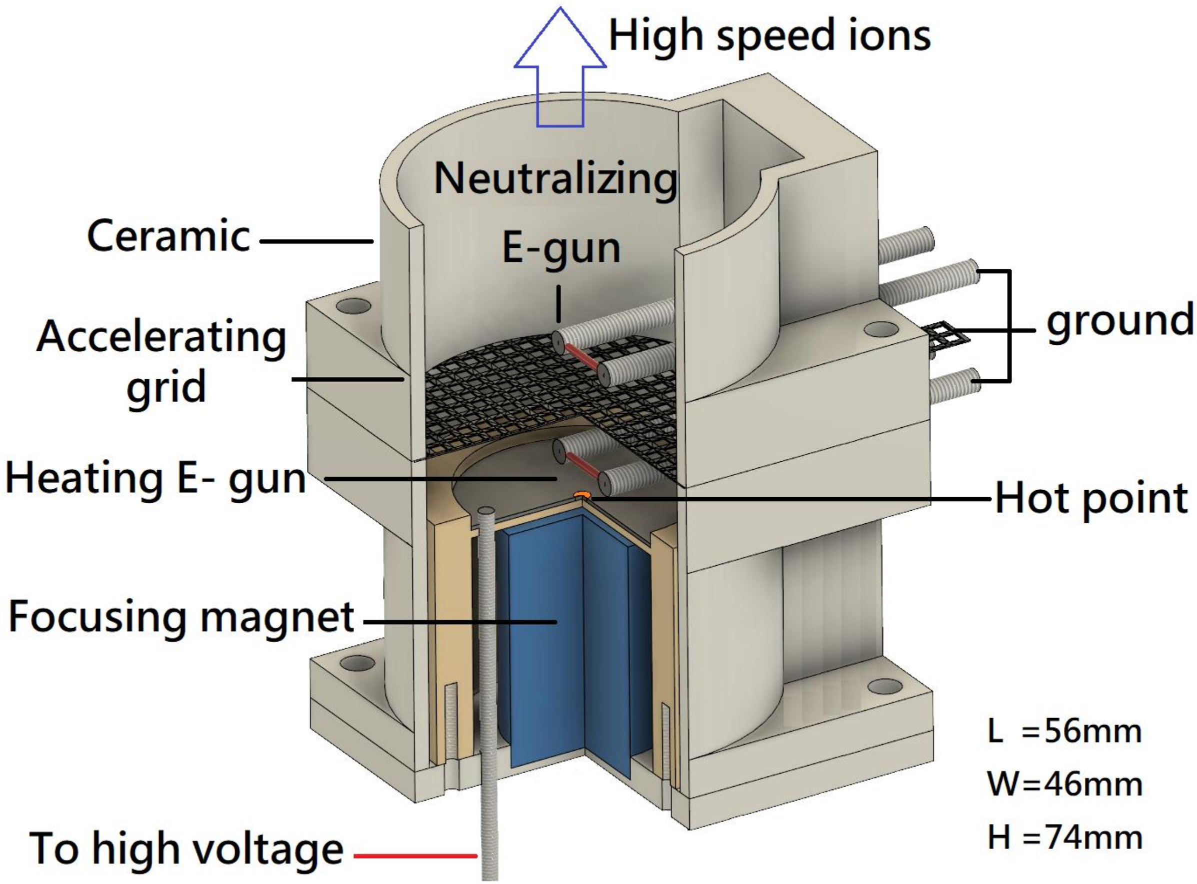
$$\dot{m}_i = \frac{I_b M}{q}$$

$$\boxed{T = \sqrt{\frac{2M}{e}}\, I_b \sqrt{V_b}\ (\mathrm{Nt})}$$

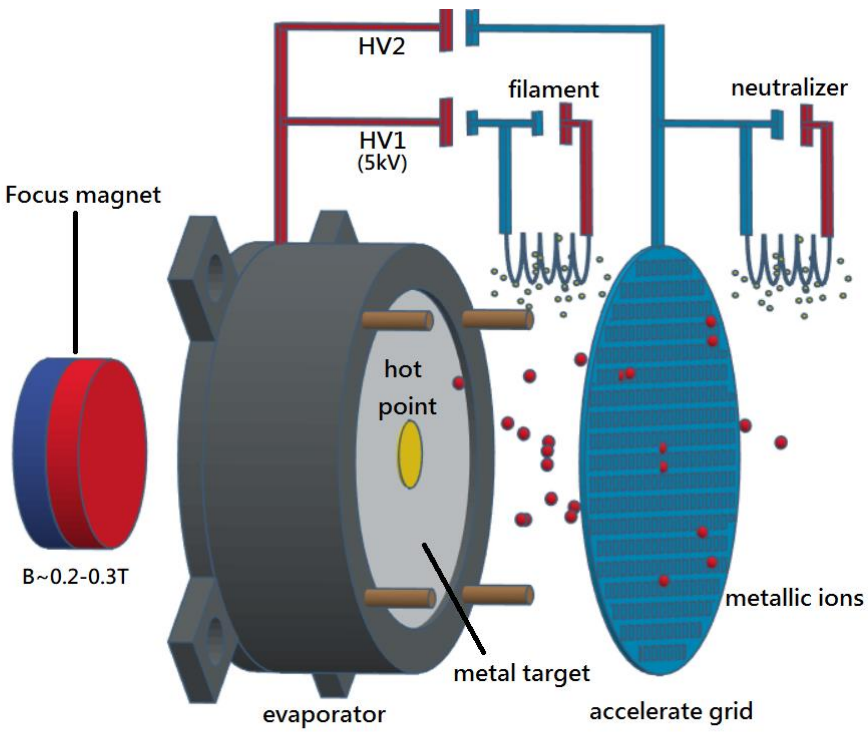
Ion thruster has the highest specific impulse (Isp)

Thruster	Specific Impulse (s)	Input Power (kW)	Efficiency Range (%)	Propellant
Cold gas	50–75	—	—	Various
Chemical (monopropellant)	150–225	—	—	N_2H_4 H_2O_2
Chemical (bipropellant)	300–450	—	—	Various
Resistojet	300	0.5–1	65–90	N_2H_4 monoprop
Arcjet	500–600	0.9–2.2	25–45	N_2H_4 monoprop
Ion thruster	2500–3600	0.4–4.3	40–80	Xenon
Hall thrusters	1500–2000	1.5–4.5	35–60	Xenon
PPTs	850–1200	<0.2	7–13	Teflon

Metallic Ion Thruster Using Magnetron E-Beam Bombardment (MIT-MEB)



Electrons are used to generate metallic gas, metallic plasma and to neutralize ions



heating

external electric field

electron bombardment

accelerated electric field

filament → Thermal electron → target → vapor → plasma → exhaust

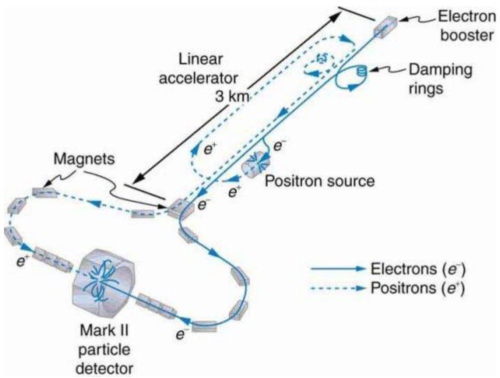
evaporated

ionized

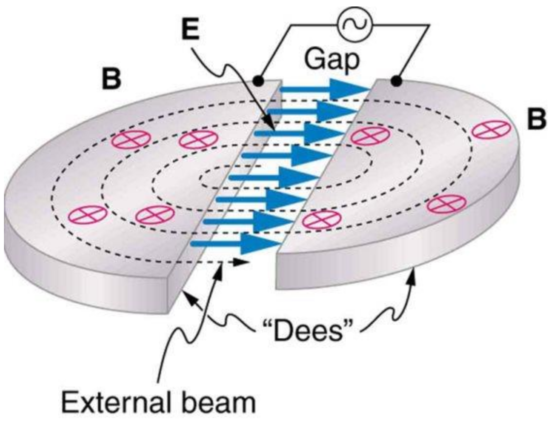
neutralizer

High energy particle accelerator

- linear particle accelerator (Linac)



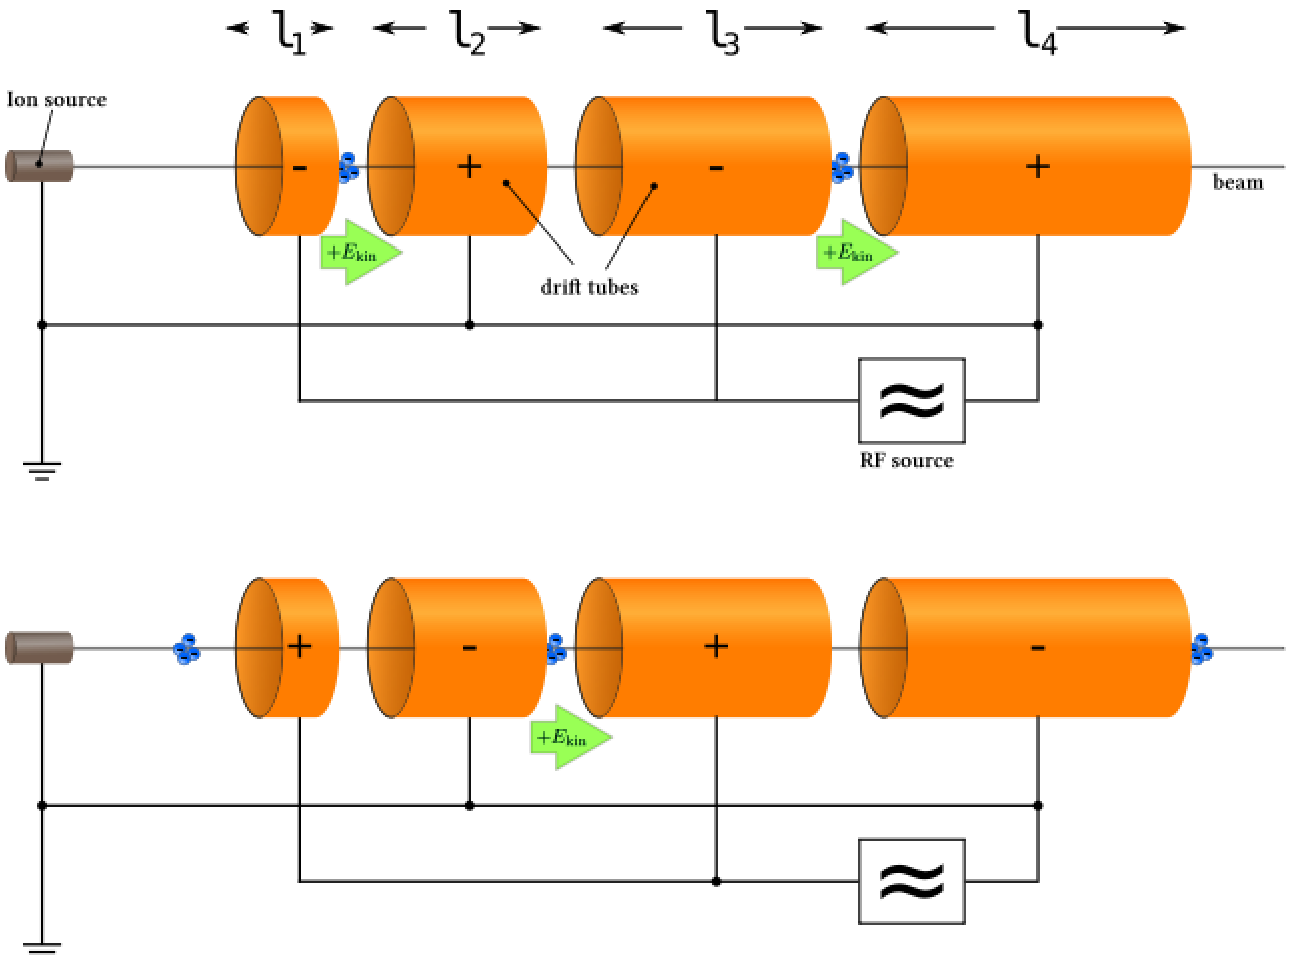
- Cyclotron



- Synchrotron

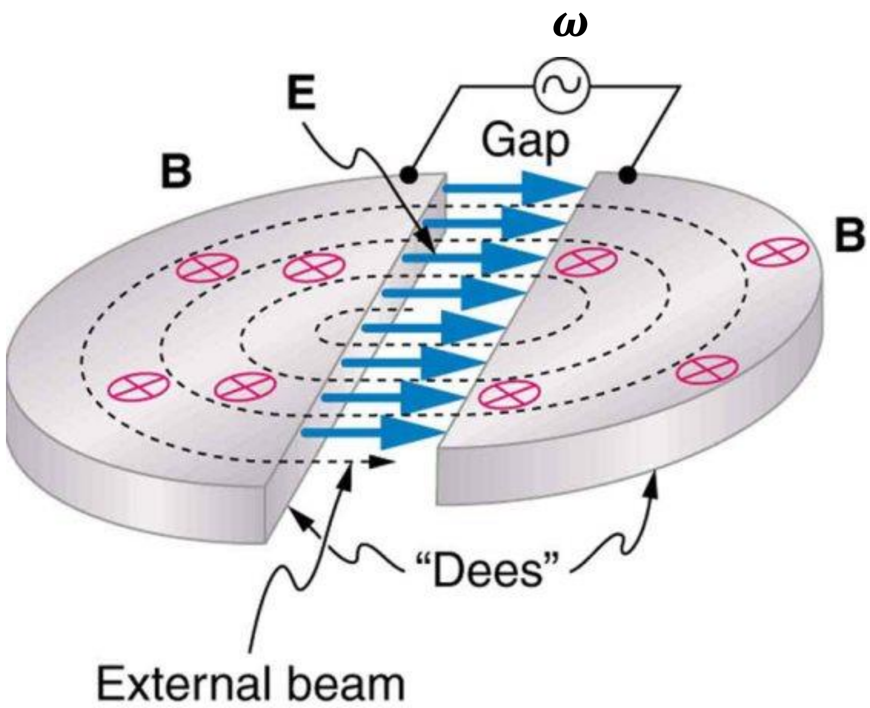
- Reference: Introduction to plasma phenomena and plasma medicine, Y. Nishida and K.-L. Ou

A linear particle accelerator (linac) accelerates charged particles using a series of oscillating electric potentials along a linear beamline



https://en.wikipedia.org/wiki/Linear_particle_accelerator

Cyclotrons use a magnetic field to cause particles to move in circular orbits



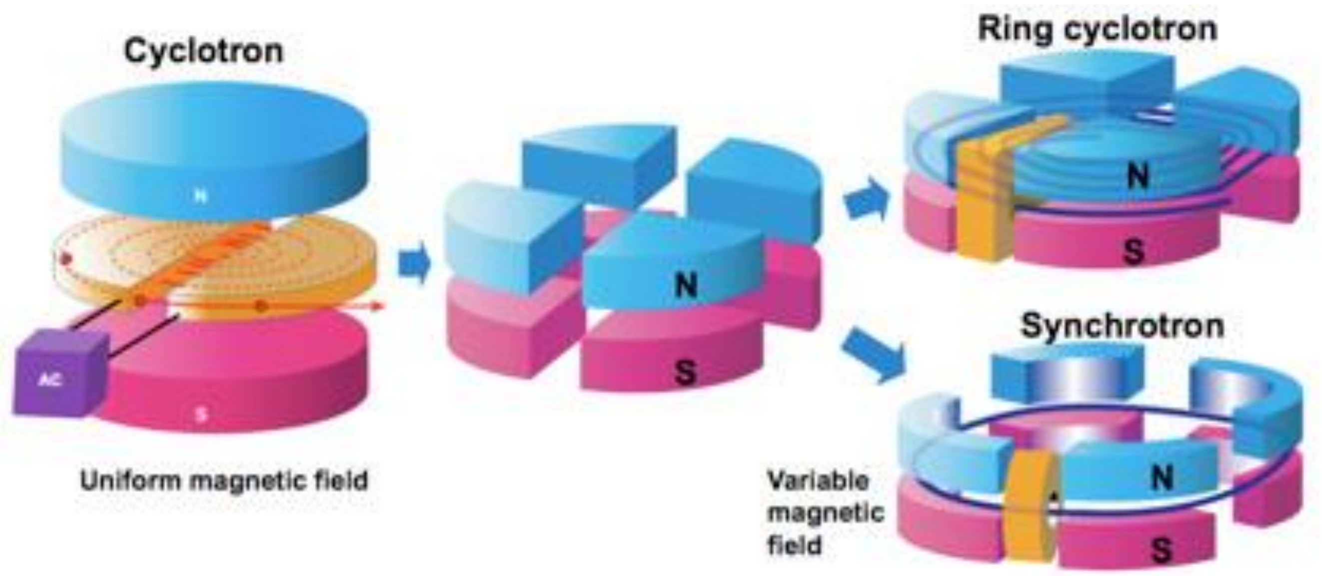
$$\omega_{\mathrm{ce}} = \frac{eB}{m_e c}$$

$$r_e = \frac{v}{\omega_{\mathrm{ce}}} = \frac{m_e c v}{eB}$$

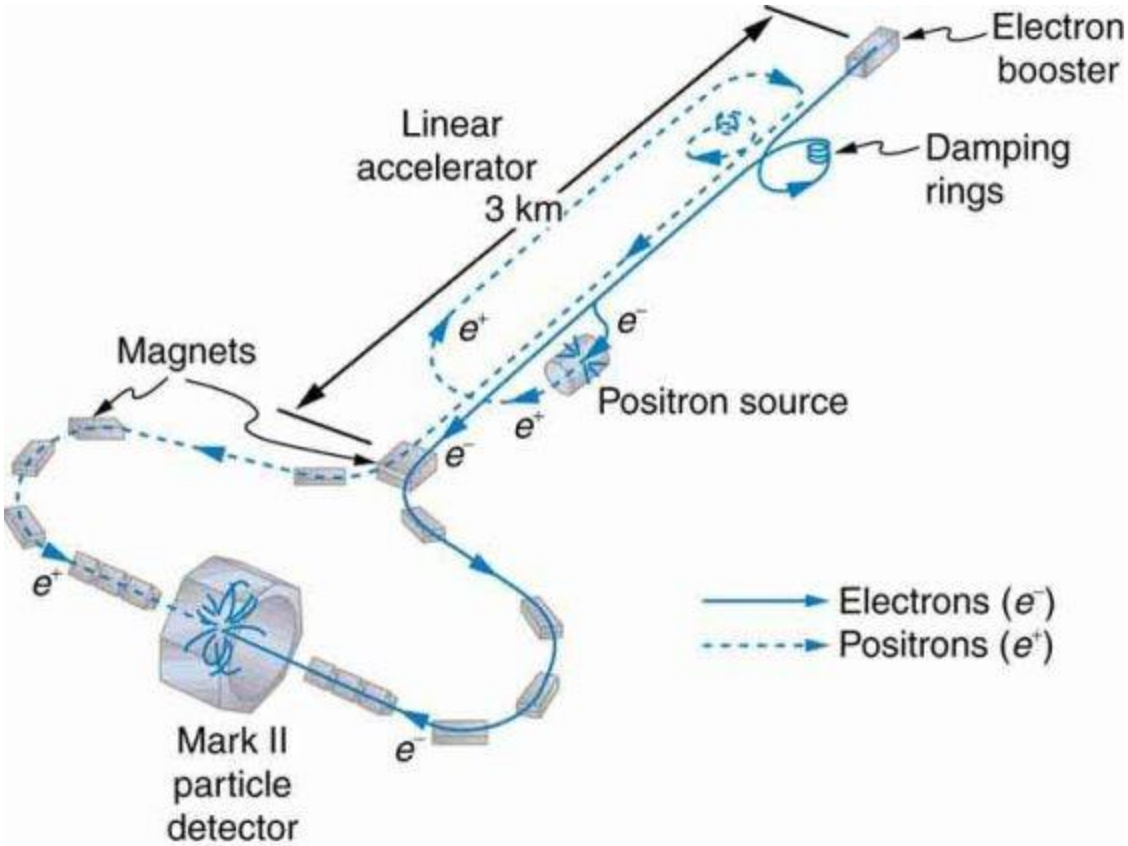
- **Cyclotron was invented by Ernest Lawrence who earned the 1939 Nobel price in physics**

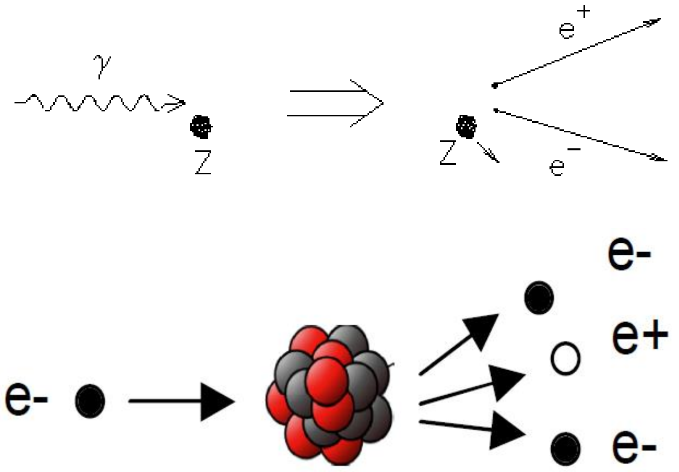
http://math.ubooks.pub/Books/ON/M1/1704/C33S4M004.html

Synchrotron uses time-dependent guiding magnetic field synchronized to a particle beam



Stanford linear accelerator center (SLAC) is a 50 GeV electron / positron accelerator





http://cnx.org/contents/aypTUEkP@4/Accelerators-Create-Matter-fro

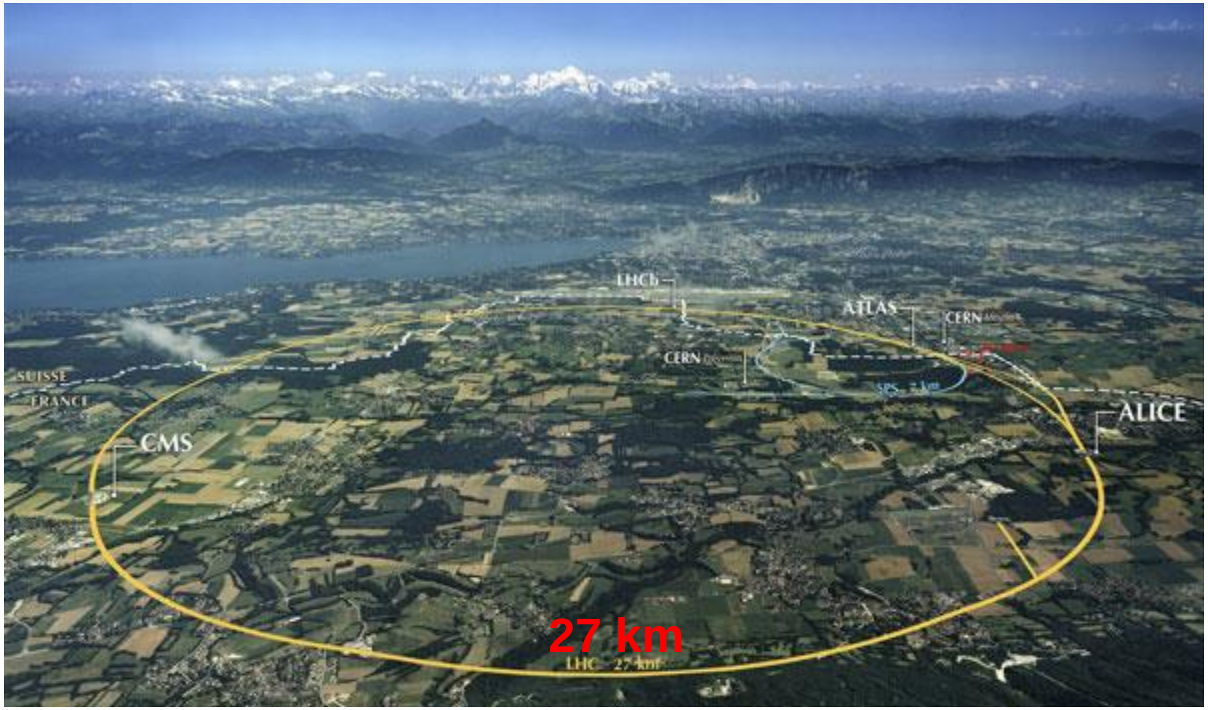
Large Hadron Collider (LHC) is the world's largest and most powerful particle collider providing 13 TeV protons



http://www.coepp.org.au/large-hadron-collider

Plasma based accelerators will become 3 orders smaller than the regular microwave based accelerator

- **Maximum field strength:**
  - **Microwave: 100 MV/m**
  - **Plasma: >10 GV/m, 300 GV/m was achieved using laser wakefield accelerator[1]**

- **Plasma based high energy accelerators:**
  - **V_pxB or surfatron accelerator[2]**
  - **Plasma wakefield accelerator (PWFA)[3]**
  - **Plasma beat wave accelerator (PBWA)[4]**
  - **Laser wakefield accelerator (LWFA)[4]**

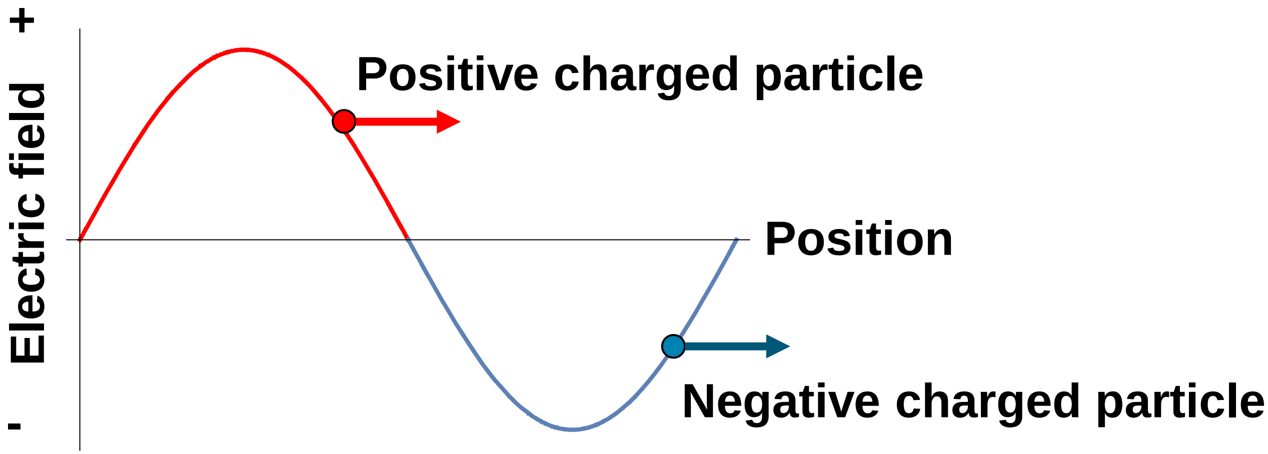
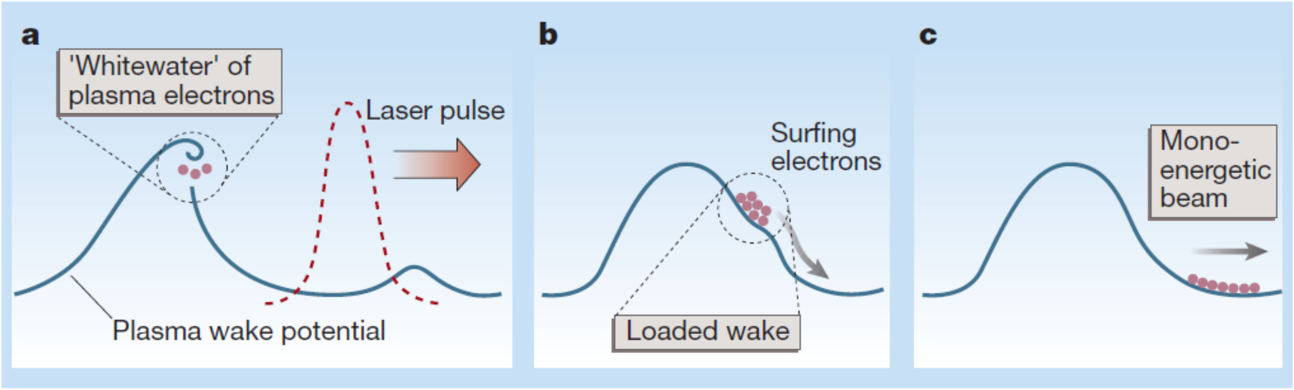
[3] P. Chen, *et al.*, Phys. Rev. Lett. **54**, 693 (1985)
[4] T. Tajima and J. M. Dawson, Phys. Rev. Lett. **43**, 267 (1979)

Charged particles can be accelerated in the wave electric field





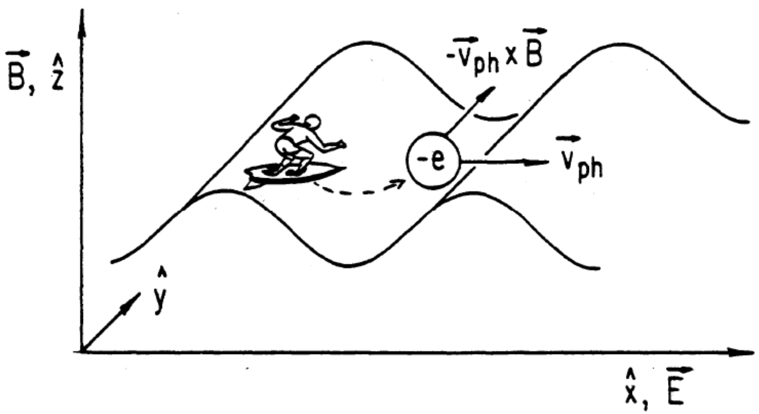
T. Katsouleas, Nature **431**, 515 (2004)

Who will catch the wave?

https://lightsabersandsurfboards.wordpress.com/tag/lake-erie-surfing/

The surfer glides in a direction not parallel to the wave direction to be in phase to the wave propagation

Electrons may be accelerated to speed of light using V_pxB acceleration (Surfatron)



- **Plane wave electric field and uniform magnetic field:**

$$\vec{E} = E_0 \sin(\mathrm{kx} - \omega \mathrm{t})\hat{x}$$

$$\vec{B} = \mathrm{B}\hat{z}$$

$$\frac{d}{dt}(\gamma v_x) = \frac{qE_0}{m}\sin(\mathrm{kx} - \omega\mathrm{t}) + \omega_c v_y$$

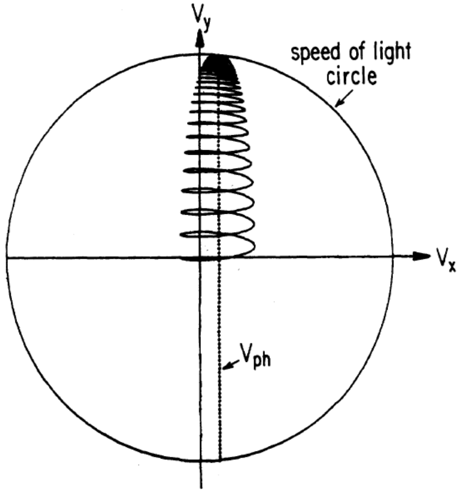
$$\frac{d}{dt}(\gamma v_y) = -\omega_c v_x \qquad \gamma = \frac{1}{\sqrt{1 - \frac{{v_x}^2 + {v_y}^2}{c^2}}}$$

- **On the wave frame and if the particle is trapped in the wave:**

$$x_1 = x - v_{\mathrm{ph}} t \qquad \frac{d}{dt}(\gamma v_x) = 0$$

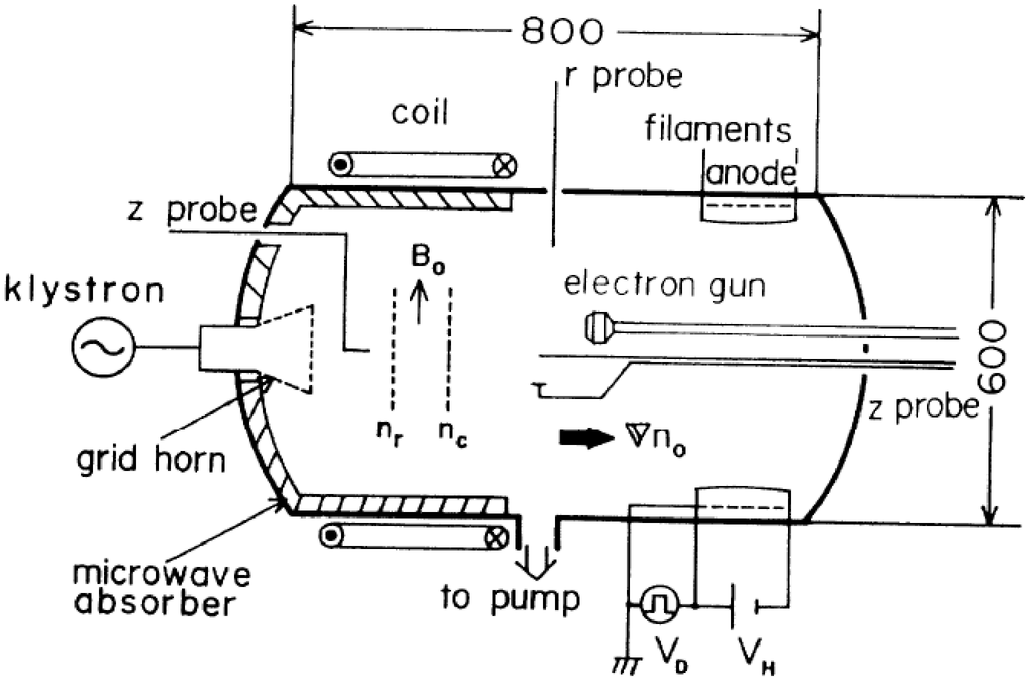
$$v_x \to v_{\mathrm{ph}}$$

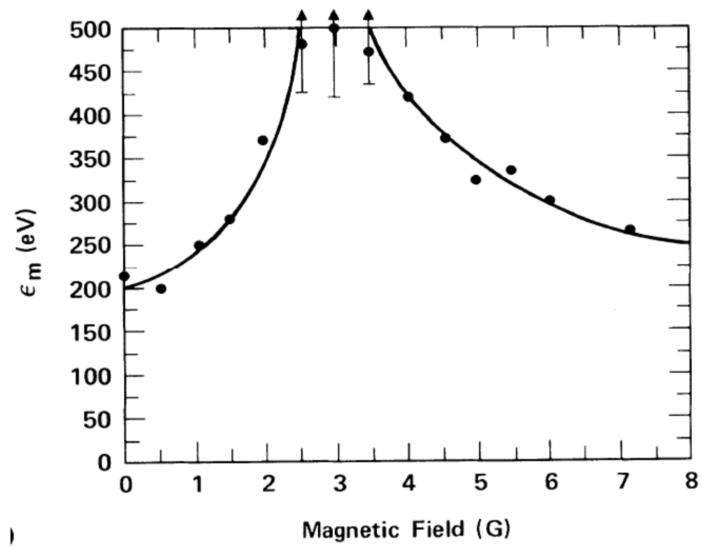
$$v_y = -\frac{\omega_c v_{\mathrm{ph}} t}{\gamma_{\mathrm{ph}}\sqrt{1 + \frac{{\omega_c}^2 t^2 {v_{\mathrm{ph}}}^2}{c^2}}}$$



- T. Katsouleas, *et al.*, PRL **51**, 392 (1983)
- T. Katsouleas, *et al.*, IEEE TNS. **NS-30**, 3241 (1983)
- Y. Nishida, *et al.*, AIP Conf Proc. **737**, 957 (2004)

Experimental results of V_pxB acceleration (Surfatron)

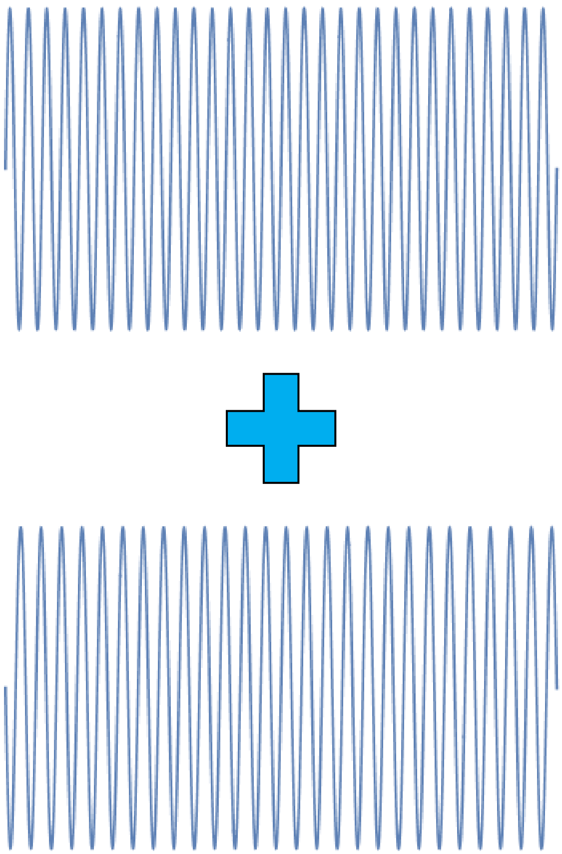


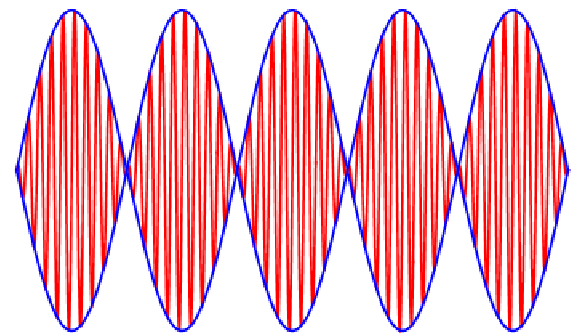


- n_0 ~ 1-30 x 10^{17} m^{-3}
- T_e ~ 2-5 eV
- T_i ~ 0.1-0.2 eV
- Microwave frequency: 3-10 GHz

C. Domier, *et al.*, Phys. Rev. Lett. **63**, 1803 (1989)

Plasma beat wave accelerator





$$\boldsymbol{sin}(\,\boldsymbol{x_1}) + \mathbf{sin}(\,\boldsymbol{x_2}) = \mathbf{2\,sin}\left(\frac{\boldsymbol{x_1} + \boldsymbol{x_2}}{\mathbf{2}}\right)\,\mathbf{cos}\left(\frac{\boldsymbol{x_1} - \boldsymbol{x_2}}{\mathbf{2}}\right)$$

A plasma wave is driven by the laser beat wave

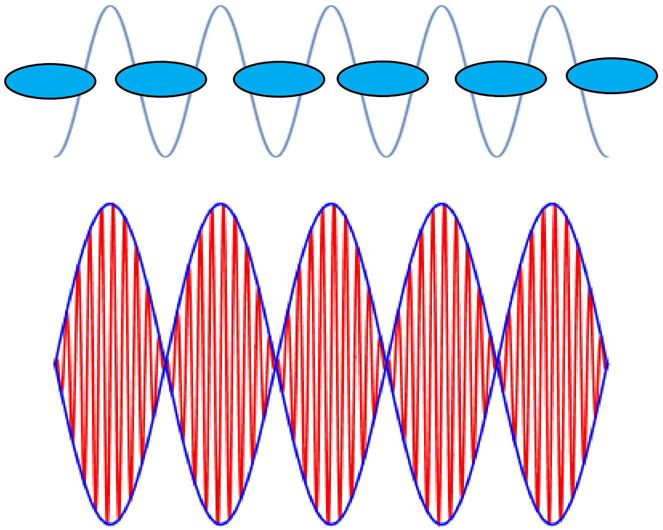
$$\omega_0 = \omega_2 - \omega_1$$

$$k_0 = k_2 - k_1$$

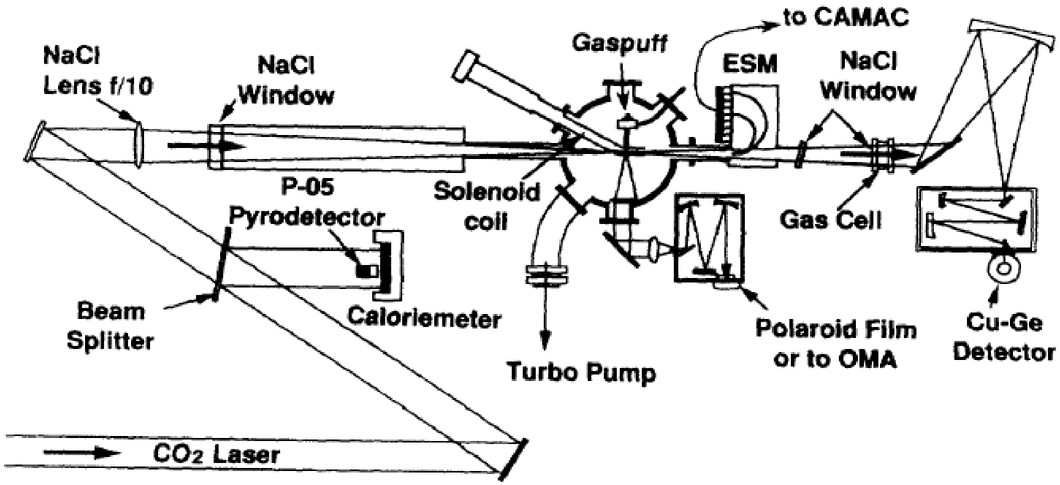
$$v_{\text{ph}} = v_g = c\sqrt{1 - \frac{{\omega_p}^2}{{\omega_0}^2}}$$

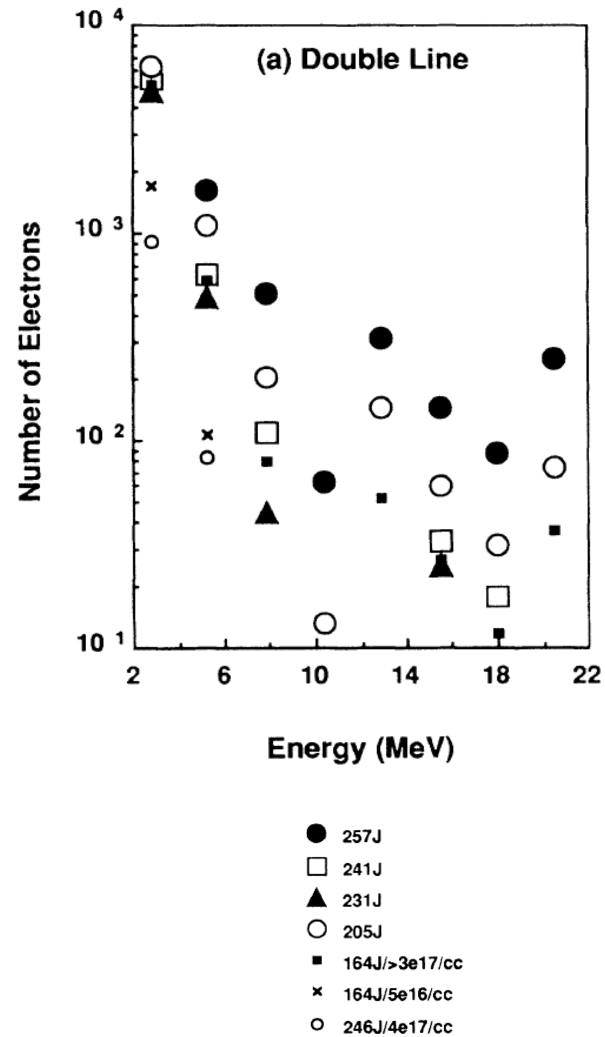
$$F = -e\nabla\phi_p = -\nabla\frac{e^2 E^{(1)} \cdot E^{(2)*}}{\mathrm{m}\omega_1\omega_2}$$

Plasma wave



Electrons were accelerated to over 20 MeV using plasma beat wave accelerator





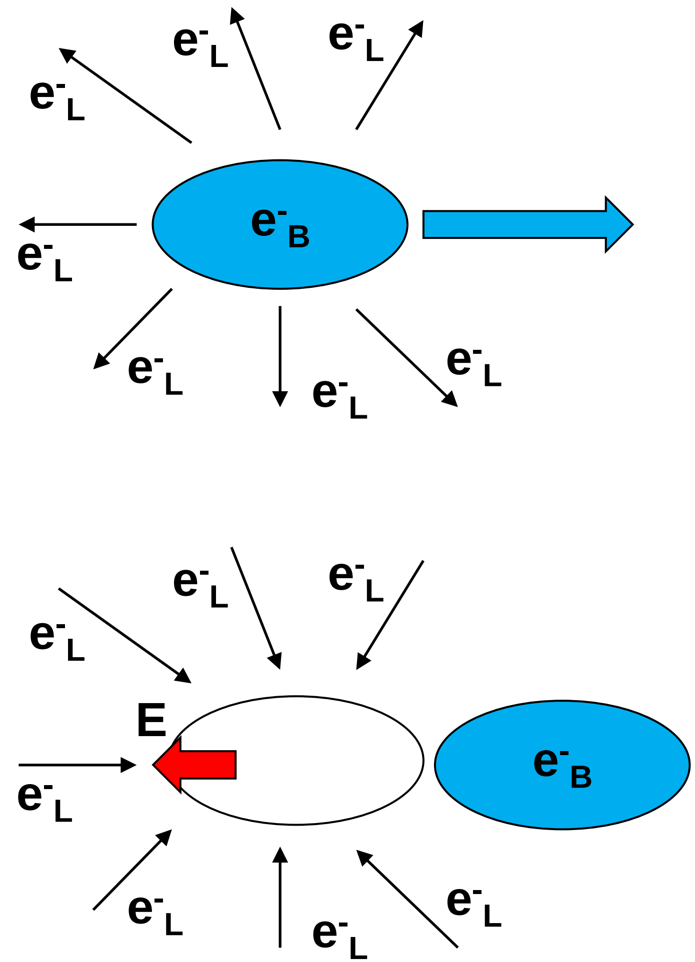
Laser: 10.6 um + 9.57 um
Intensity: 2×10^{13} ~ 2×10^{14} W/cm^2
Injected E-beam: 0.1~1 MeV
n_0=3×10^{16} ~ 7×10^{17} cm^{-3}

Y. Kitagawa, *et al.*, Phys. Rev. Lett. **68**, 48 (1992)

Plasma wakefield accelerator employs two beams

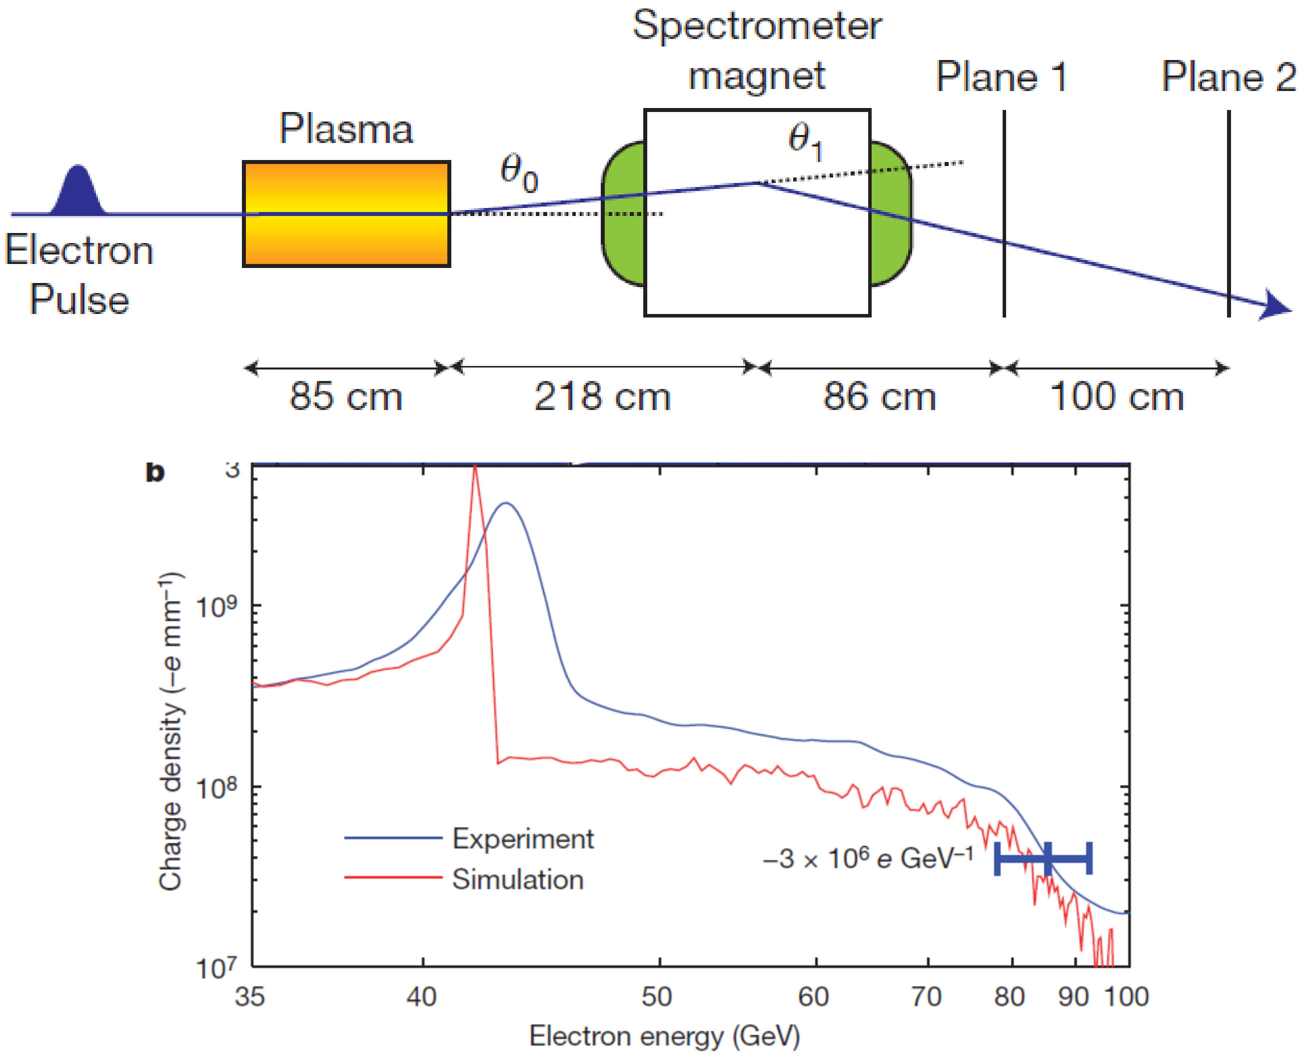
- When a bunch of electrons enter the plasma, they expel local electrons.
- When the bunch of electrons leave the plasma, the local electrons try to return but oscillate around their original locations and generate a wake field behind the bunch.
- The longitudinal field of the wake can accelerate the particles in the back.

- Key components:
  - Drive bunch: excite wake-field
  - Test bunch: beam that is accelerated to high energy



T. Katsouleas, Phys. Rev. A **33**, 2056 (1986)

Energy doubling of 42 GeV electrons in a metre-scale plasma wakefield accelerator



I. Blumenfeld, *et al.*, Nature **445**, 741 (2007)

Dream beam – the dawn of compact particle accelerators

Front page of nature, 30 Sep., 2004

Ponderomotive force expelled electrons away from the higher electric field region

$$m_s\ddot{x} = q_s E = q_s E_0(x)\cos\omega t$$

$x = x_0 + x_1$ where $x_0 = \overline{x}$

$$m_s(\ddot{x}_0 + \ddot{x}_1) = q_s\left(E_0 + x_1\frac{dE_0}{dx}\right)\cos\omega t$$

- Take time average:

$$m_s\ddot{x}_0 = q_s\left.\frac{dE_0}{dx}\right|_{x_0}\overline{x_1\cos\omega t}$$

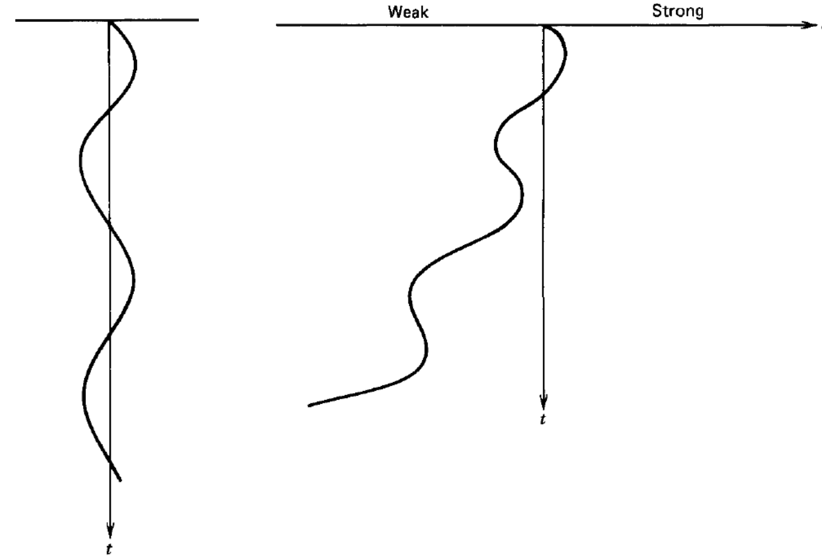
- $\ddot{x}_1 \gg \ddot{x}_0$, $E_0 >> x_1\frac{dE_0}{dx}$

$$m_s\ddot{x}_1 = q_s E_0\cos\omega t$$

$$x_1 = -\frac{q_s E_0}{m_s\omega^2}\cos\omega t$$

$$\ddot{x}_0 = -\frac{{q_s}^2 E_0}{2{m_s}^2\omega^2}\frac{dE_0}{dx}$$

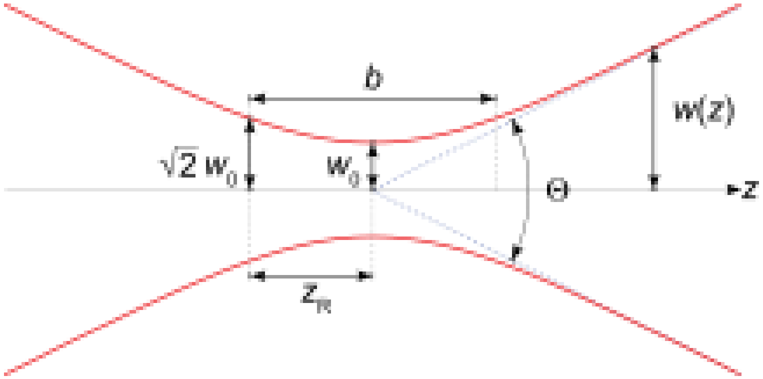
$$\frac{dE_0}{dx} = 0 \qquad\qquad \frac{dE_0}{dx} > 0$$



$$\boxed{F_p = m_s\ddot{x}_0 = -\frac{{q_s}^2}{4m_s\omega^2}\frac{d}{dx}\left({E_0}^2\right)}$$

Laser is used to create a bunch in laser wakefield accelerator

$$I(r,z) = \frac{2P}{\pi w^2(z)} \exp\left[-\frac{2r^2}{w^2(z)}\right]$$



- **Waist:** $w(z) = w_0\sqrt{1 + \frac{z^2}{{z_R}^2}}$
- **Rayleigh length:** $z_R = \frac{\pi {w_0}^2}{\lambda_L}$

Bubble/blow-out regime
